What Is The Nation's Report Card™?

The Nation's Report Card™ informs the public about the academic achievement of elementary and secondary students in the United States. Report cards communicate the findings of the National Assessment of Educational Progress (NAEP), a continuing and nationally representative measure of achievement in various subjects over time.

Since 1969, NAEP assessments have been conducted periodically in reading, mathematics, science, writing, U.S. history, civics, geography, and other subjects. NAEP collects and reports information on student performance at the national, state, and local levels, making the assessment an integral part of our nation's evaluation of the condition and progress of education. Only academic achievement data and related background information are collected. The privacy of individual students and their families is protected.

NAEP is a congressionally authorized project of the National Center for Education Statistics (NCES) within the Institute of Education Sciences of the U.S. Department of Education. The Commissioner of Education Statistics is responsible for carrying out the NAEP project. The National Assessment Governing Board oversees and sets policy for NAEP.

Executive Summary

Representative samples of fourth- and eighth-grade public school students from 21 urban districts participated in the 2011 National Assessment of Educational Progress (NAEP) in mathematics. Eighteen of the districts participating in the 2011 NAEP Trial Urban District Assessment (TUDA) participated in earlier assessment years, while three districts participated for the first time in 2011. Between 1,000 and 2,700 students in each district were assessed at grades 4 and 8.

Scores higher than in 2009 for four districts at grade 4 and six districts at grade 8

At grade 4, average mathematics scores were higher in 2011 than in 2009 for public school students in the nation, large cities, and 4 of the 18 urban districts that participated in both years (figure A). In comparison to 2003, scores were higher in 2011 for 9 of the 10 districts that participated in both years, as well as for large cities and the nation.

At grade 8, average mathematics scores were higher in 2011 than in 2009 for public school students in the nation, large cities, and 6 of the 18 urban districts that participated in both years. In comparison to 2003, scores were higher in 2011 for 9 of the 10 districts that participated in both years, as well as for large cities and the nation.

▲ Higher in 2011.

◆ Not significantly different from 2011.

— District did not participate.

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. The score-point differences appear within each symbol and are based on the differences between unrounded average scores. A score-point difference preceded by a minus sign (-) indicates that the score was numerically lower in 2011. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2009, and 2011 Mathematics Assessments.

Both fourth- and eighth-graders in six districts score higher than the average for large cities in 2011

Among the 21 urban districts that participated in the 2011 mathematics assessment, scores for both fourth- and eighth-graders in 6 districts were higher than the scores for public school students attending schools in large cities (i.e., cities with populations of 250,000 or more) overall. Fourth- and eighth-graders in 10 districts scored lower than their peers in large cities.

Differences in average mathematics scores for public school students in the districts compared to the scores for large cities in 2011			
	At both grades		At grade 4 only
Higher than large cities	Austin Boston Charlotte	Hillsborough County (FL) Houston San Diego	Jefferson County (KY) Miami-Dade
Lower than large cities	Atlanta Baltimore City Chicago Cleveland Detroit	District of Columbia (DCPS) Fresno Los Angeles Milwaukee Philadelphia	
Scores for fourth- and eighth-graders in Albuquerque, Dallas, and New York City were not significantly different from the scores for students in large cities.			

NOTE: DCPS = District of Columbia Public Schools.

Compared to large cities, scores for lower-income students are higher in eight districts at grade 4 and five districts at grade 8

When comparing the results for urban districts to results for the nation and large cities, it is important to consider how the demographics of the jurisdictions are different. For example, large cities and participating urban districts differ from the nation in the proportion of students eligible for the National School Lunch Program (an indicator of lower family income). The percentages of students eligible for free/reduced-price school lunch (lower-income students) in the nation in 2011 were 52 percent at grade 4 and 48 percent at grade 8; the percentages of lower-income students in the districts ranged from 52 percent to 100 percent across the two grades.

At grade 4, average scores for both higher- and lower-income students in Austin, Charlotte, and Hillsborough County were higher than the scores for their peers in large cities (**figure B**). Scores for lower-income students in Boston, Dallas, Houston, Miami-Dade, and New York City were also higher than the score for lower-income students in large cities, although scores for higher-income students in those districts were not significantly different from large cities. But not all of the districts where scores for lower-income students were higher than the score for large cities had a smaller score gap between the two groups. The score gap between higher- and lower-income students in Boston was smaller than the score gap for large cities, while the gaps in the other districts were either larger than or not significantly different from the gap for large cities.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

At grade 8, average scores for both higher- and lower-income students in Austin and Boston were higher than the scores for their peers in large cities. Scores for lower-income students in Dallas, Houston, and New York City were also higher than the score for lower-income students in large cities, although the scores for higher-income students in those districts were not significantly different from large cities. Among those districts where scores for lower-income students were higher than the score for large cities, the score gaps between higher- and lower-income students in Dallas and Houston were smaller than the score gap for large cities, and gaps in the other districts were either larger than or not significantly different from the gap for large cities.

Three districts participated in the NAEP Trial Urban District Assessment for the first time in 2011

- Albuquerque Public Schools,
- Dallas Independent School District, and
- Hillsborough County (FL) Public Schools.

▲ Higher average score than large city.

▼ Lower average score than large city.

◆ No significant difference between the district and large city.

† Not applicable. The difference in average scores for higher- and lower-income students in Detroit was not statistically significant.

‡ Reporting standards not met. Sample size insufficient to permit a reliable estimate.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP. Score gaps are calculated based on differences between unrounded average scores. DCPS = District of Columbia Public Schools.

Introduction

As part of the National Assessment of Educational Progress (NAEP) in mathematics, results are reported for urban school districts participating in the Trial Urban District Assessment (TUDA). The primary goal of TUDA is to focus attention on urban education and measure educational progress within large urban districts. Twenty-one districts participated in the 2011 mathematics assessment, three of them for the first time.

The Mathematics Framework

The National Assessment Governing Board oversees the development of NAEP frameworks that describe the specific knowledge and skills to be assessed in each subject. Frameworks incorporate ideas and input from subject area experts, school administrators, policymakers, teachers, parents, and others. NAEP frameworks also describe the types of questions to be included and how they should be designed and scored.

Mathematics content areas

To ensure an appropriate balance of content and allow for a variety of ways of knowing and doing mathematics, the *Mathematics Framework for the 2011 National Assessment of Educational Progress* specifies that each question in the assessment measure one of five mathematical content areas. Although the names of the content areas, as well as some of the topics in those areas, have

changed over the years, there has been a consistent focus across frameworks on collecting information on students' performance in the following five areas:

Number properties and operations measures students' understanding of ways to represent, calculate, and estimate with numbers.

At grade 4, number properties and operations questions focus on computation with or understanding of whole numbers and common fractions and decimals. At grade 8, questions measure computation with rational and common irrational numbers, as well as students' ability to solve problems using proportional reasoning and apply properties to select number systems.

Measurement assesses students' knowledge of units of measurement for such attributes as capacity, length, area, volume, time, angles, and rates.

At grade 4, measurement questions focus on customary units such as inch, quart, pound, and hour, and common metric units such as centimeter, liter, and gram, as well as the geometric attribute of length. At grade 8, questions concentrate on the use of square units for measuring area and surface area, cubic units for measuring volume, degrees for measuring angles, and rates.

Geometry measures students' knowledge and understanding of shapes in two and three dimensions, and relationships between shapes such as symmetry and transformations.

At grade 4, geometry questions focus on simple figures and their attributes, including plane figures such as triangles and circles and solid figures such as cubes and spheres. At grade 8, questions address the properties of plane figures, especially parallel and perpendicular lines, angle relationships in polygons, cross sections of solids, and the Pythagorean theorem.

Data analysis, statistics, and probability measures students' understanding of data representation, characteristics of data sets, experiments and samples, and probability.

At grade 4, data analysis, statistics, and probability questions focus on students' understanding of how data are collected and organized, how to read and interpret various representations of data, and basic concepts of probability. At grade 8, questions address organizing and summarizing data (including tables, charts, and graphs), analyzing statistical claims, and probability.

Algebra measures students' understanding of patterns, using variables, algebraic representation, and functions.

At grade 4, algebra questions measure students' understanding of algebraic representation, patterns, and rules; graphing points on a line or a grid; and using symbols to represent unknown quantities. At grade 8, questions measure students' understanding of patterns and functions; algebraic expressions, equations, and inequalities; and algebraic representations, including graphs.

Levels of mathematical complexity

The framework describes three levels of mathematical complexity that reflect the cognitive demands that questions make on students' thinking.

Low complexity questions typically specify what a student is to do, which is often to carry out a routine mathematical procedure.

Moderate complexity questions involve more flexibility of thinking and often require a response with multiple steps.

High complexity questions make heavier demands on students' thinking and often require abstract reasoning or analysis in a novel situation.

Mathematical complexity involves *what* a question asks students to do and *not how* they might undertake it. The complexity of a question is not directly related to its format, and therefore it is possible for some multiple-choice questions to assess complex mathematics and for some constructed-response (i.e., open-ended) questions to assess routine mathematical ideas.

Mathematics Framework for the 2011 National Assessment of Educational Progress

The complete mathematics framework for the 2011 assessment is available at <http://www.nagb.org/publications/frameworks/math-2011-framework.pdf> and contains detailed information on the mathematical content areas, levels of complexity, format of assessment questions, and assessment design.

Updates to the framework over the years have provided more detail regarding the assessment design for grades 4 and 8 but have not changed the content, allowing for the comparison of students' performance in 2011 to previous assessment years.

Assessment Design

Because the 2011 mathematics assessment covered a breadth of content and included more questions than any one student could answer, each student took just a portion of the assessment. The 158 questions that made up the entire fourth-grade assessment were divided into 10 sections, each containing between 15 and 19 questions, depending on the balance between multiple-choice and constructed-response questions. The eighth-grade assessment contained 155 questions that were divided into 10 sections of between 14 and 17 questions. At both grades, each student responded to questions in two 25-minute sections.

Some questions incorporated the use of rulers (at grade 4) or ruler/protractors (at grade 8), and some questions incorporated the use of geometric shapes or other manipulatives that were provided for students. Twenty percent of the fourth-grade assessment allowed for the use of a four-function calculator that was provided to students. Thirty percent of the eighth-grade assessment allowed for the use of a scientific or graphing calculator; students could either use their own calculator or one provided by NAEP.

The proportion of assessment questions devoted to each of the five content areas varied by grade to reflect the differences in emphasis in each area specified in the framework (**table 1**). The largest portion of the fourth-grade assessment focused on number properties and operations (40 percent), and the largest portion of the eighth-grade assessment focused on algebra (30 percent).

Table 1. Target percentage distribution of NAEP mathematics questions, by grade and content area: 2011

Content area	Grade 4	Grade 8
Number properties and operations	40	20
Measurement	20	15
Geometry	15	20
Data analysis, statistics, and probability	10	15
Algebra	15	30

Reporting NAEP Results

The urban school districts participating in the TUDA assessment all have a population of 250,000 or more and a majority of students who are Black, or Hispanic, or eligible for participation in the National School Lunch Program (or other appropriate indicator of poverty). Additional information about district eligibility requirements and selection procedures can be found on the Governing Board's website at <http://www.nagb.org/policies/PoliciesPDFs/Program%20Administration/Trial%20Urban%20District%20Assessment%20Policy.pdf>.

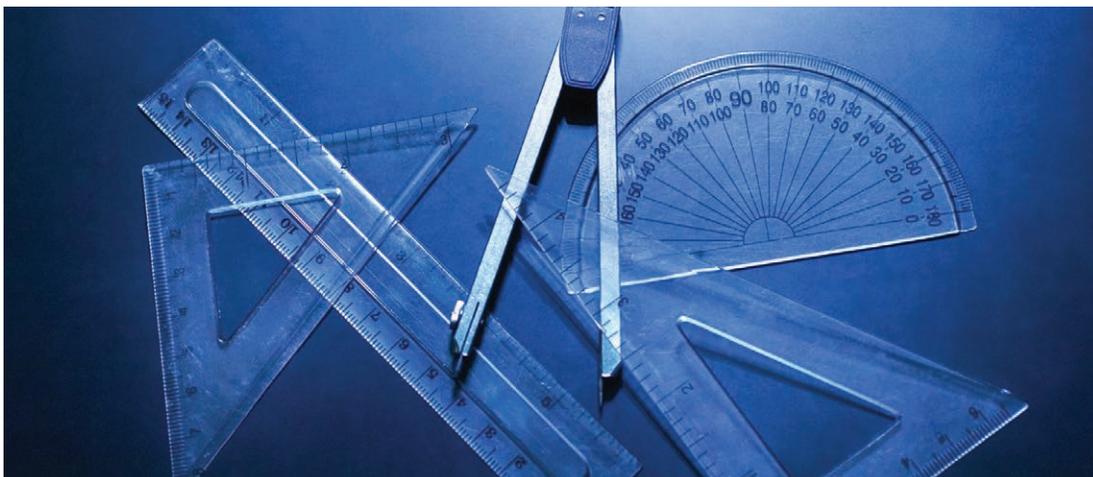

The 2011 mathematics assessment results are reported for public school students in 21 districts. The following 18 districts participated in 2011, as well as in at least one of four earlier assessment years:

Atlanta Public Schools	Fresno Unified School District
Austin Independent School District	Houston Independent School District
Baltimore City Public Schools	Jefferson County Public Schools (Louisville, KY)
Boston Public Schools	Los Angeles Unified School District
Charlotte-Mecklenburg Schools	Miami-Dade County Public Schools
Chicago Public Schools	Milwaukee Public Schools
Cleveland Metropolitan School District	New York City Department of Education
Detroit Public Schools	San Diego Unified School District
District of Columbia Public Schools	School District of Philadelphia

The following three districts participated for the first time in 2011:

Albuquerque Public Schools
Dallas Independent School District
Hillsborough County (FL) Public Schools

Representative samples of between 1,100 and 2,700 fourth-graders and between 1,000 and 2,500 eighth-graders were assessed in each district. (See appendix **table A-1** for the number of participating schools and the number of students assessed in each district.) Some charter schools that operate within the geographic boundaries of a school district are independent of the district and are not included in the district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education under the Elementary and Secondary Education Act. Beginning in 2009, charter schools of this type are no longer included in the results for TUDA districts as they had been in past NAEP assessments.

Explore Additional Results

Not all of the results from the NAEP mathematics assessment are presented in this report. Additional results (including average scores in each of the five mathematical content areas) can be found on the Nation's Report Card website at http://nationsreportcard.gov/math_2011/ and in the NAEP Data Explorer at <http://nces.ed.gov/nationsreportcard/naepdata/>.

Scale scores

NAEP mathematics results for grades 4 and 8 are reported as average scores on a 0–500 scale. Because NAEP scales are developed independently for each subject, scores cannot be compared across subjects.

In addition to reporting an overall mathematics score for each grade, scores are reported at five percentiles to show trends in results for students performing at lower (10th and 25th percentiles), middle (50th percentile), and higher (75th and 90th percentiles) levels (see appendix [table A-9](#)).

Achievement levels

Based on recommendations from policymakers, educators, and members of the general public, the Governing Board sets specific achievement levels for each subject area and grade. Achievement levels are performance standards showing what students should know and be able to do. NAEP results are reported as percentages of students performing at or above the *Basic* and *Proficient* levels and at the *Advanced* level.

Basic denotes partial mastery of prerequisite knowledge and skills that are fundamental for proficient work at each grade.

Proficient represents solid academic performance. Students reaching this level have demonstrated competency over challenging subject matter.

Advanced represents superior performance.

As provided by law, the National Center for Education Statistics (NCES), upon review of congressionally mandated evaluations of NAEP, has determined that achievement levels are to be used on a trial basis and should be interpreted with caution. The NAEP achievement levels have been widely used by national and state officials.

Interpreting the Results

Differences in performance over time and between student groups

The performance of students in each urban district is compared to the performance of public school students in the nation and in large cities (i.e., cities with populations of 250,000 or more). The comparison to the nation's large cities is made because students in these cities represent a peer group with characteristics that are most similar to the characteristics of students in the 21 TUDA districts. Comparisons in performance over time are made for those districts that participated in earlier assessment years.

NAEP reports results using widely accepted statistical standards; findings are reported based on a statistical significance level set at .05 with appropriate adjustments for multiple comparisons, as well as adjustments for the part-whole relationship when individual districts are compared to results for large cities or the nation (see the Technical Notes for more information). An asterisk (*) is used in tables and figures to indicate that the scores or percentages being compared are significantly different. Only those differences that are found to be statistically significant are discussed as higher or lower.

A score that is significantly higher or lower in comparison to an earlier assessment year is reliable evidence that student performance has changed. However, NAEP is not designed to identify the causes of these changes. Although comparisons are made in students' performance based on demographic characteristics, the results cannot be used to establish a cause-and-effect relationship between student characteristics and achievement. Many factors may influence student achievement, including, but not limited to, educational policies and practices, available resources, student mobility, and the demographic characteristics of the student body. These factors may change over time and vary among student groups.

Accommodations and exclusions in NAEP

It is important to assess all selected students from the population, including students with disabilities (SD) and English language learners (ELL). To accomplish this goal, many of the same accommodations that students use on other tests (e.g., extra testing time or individual rather than group administration) are provided for SD and ELL students participating in NAEP. Even with the availability of accommodations, some students may still be excluded. Differences in student populations and in state policies and practices for identifying and including SD and ELL students should be considered when comparing variations in exclusion and accommodation rates. Districts also vary in their proportions of special-needs students (especially ELL students).

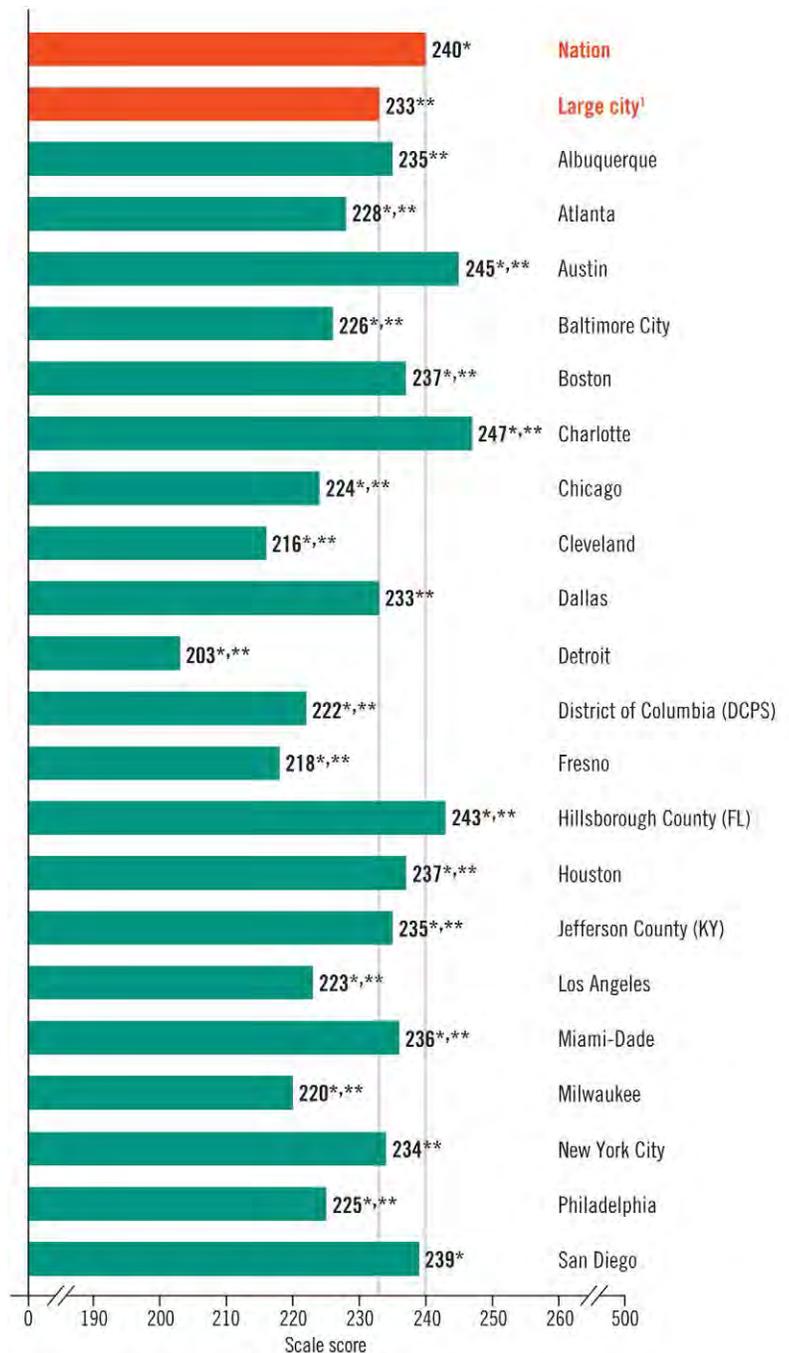

The National Assessment Governing Board has been exploring ways to reduce variation in exclusion rates for SD and ELL students across states and districts. See the section in this report on NAEP Inclusion for more information about the Governing Board's new policy on inclusion.

Three districts score higher than both the national average and large cities overall

In 2011, the average mathematics score for fourth-graders attending public schools in large cities was 7 points lower than the score for public school students in the nation (figure 1). Scores for 3 of the 21 participating districts were higher than the scores for both the nation and large cities overall, and scores for 10 districts were lower than both the nation and large cities.

- Scores for Austin, Charlotte, and Hillsborough County were higher than the scores for both the nation and large cities.
- The score for San Diego was not significantly different from the score for the nation but was higher than the score for large cities.
- Scores for Boston, Houston, Jefferson County, and Miami-Dade were lower than the national average but higher than the score for large cities.
- Scores for Albuquerque, Dallas, and New York City were lower than the nation but not significantly different from large cities.
- Scores were lower than both the nation and large cities in Atlanta, Baltimore City, Chicago, Cleveland, Detroit, the District of Columbia, Fresno, Los Angeles, Milwaukee, and Philadelphia.

Figure 1. Average scores in NAEP mathematics for fourth-grade public school students, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.
 ** Significantly different ($p < .05$) from the nation.
¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: DCPS = District of Columbia Public Schools.

Nine districts score higher than in 2003, and four score higher than in 2009

Eighteen of the 21 districts that participated in the 2011 mathematics assessment participated in 2009, and 10 participated in the first TUDA assessment in 2003. The results from earlier assessments make it possible to examine how the performance for students overall and for student groups in those districts has changed over time. Some of the results summarized here are provided in more detail in the profiles for each district presented later in this report.

In comparison to 2003, average mathematics scores were higher in 2011 for fourth-graders in the nation and in large cities (figure 2). Scores were also higher in 2011 than in 2003 for the districts that participated both years with one exception—there was no significant change in the score for Cleveland.

In comparison to 2009, scores were higher in 2011 for Atlanta, Austin, Baltimore City, and Philadelphia and did not change significantly in the other 14 districts that participated in both years.

Figure 2. Changes in 2011 NAEP mathematics average scores from 2003 and 2009 for fourth-grade public school students, by jurisdiction

Jurisdiction	Change in average score	
	From 2003	From 2009
Nation	▲	▲

- ▲ Higher in 2011.
- ◆ Not significantly different from 2011.
- District did not participate.

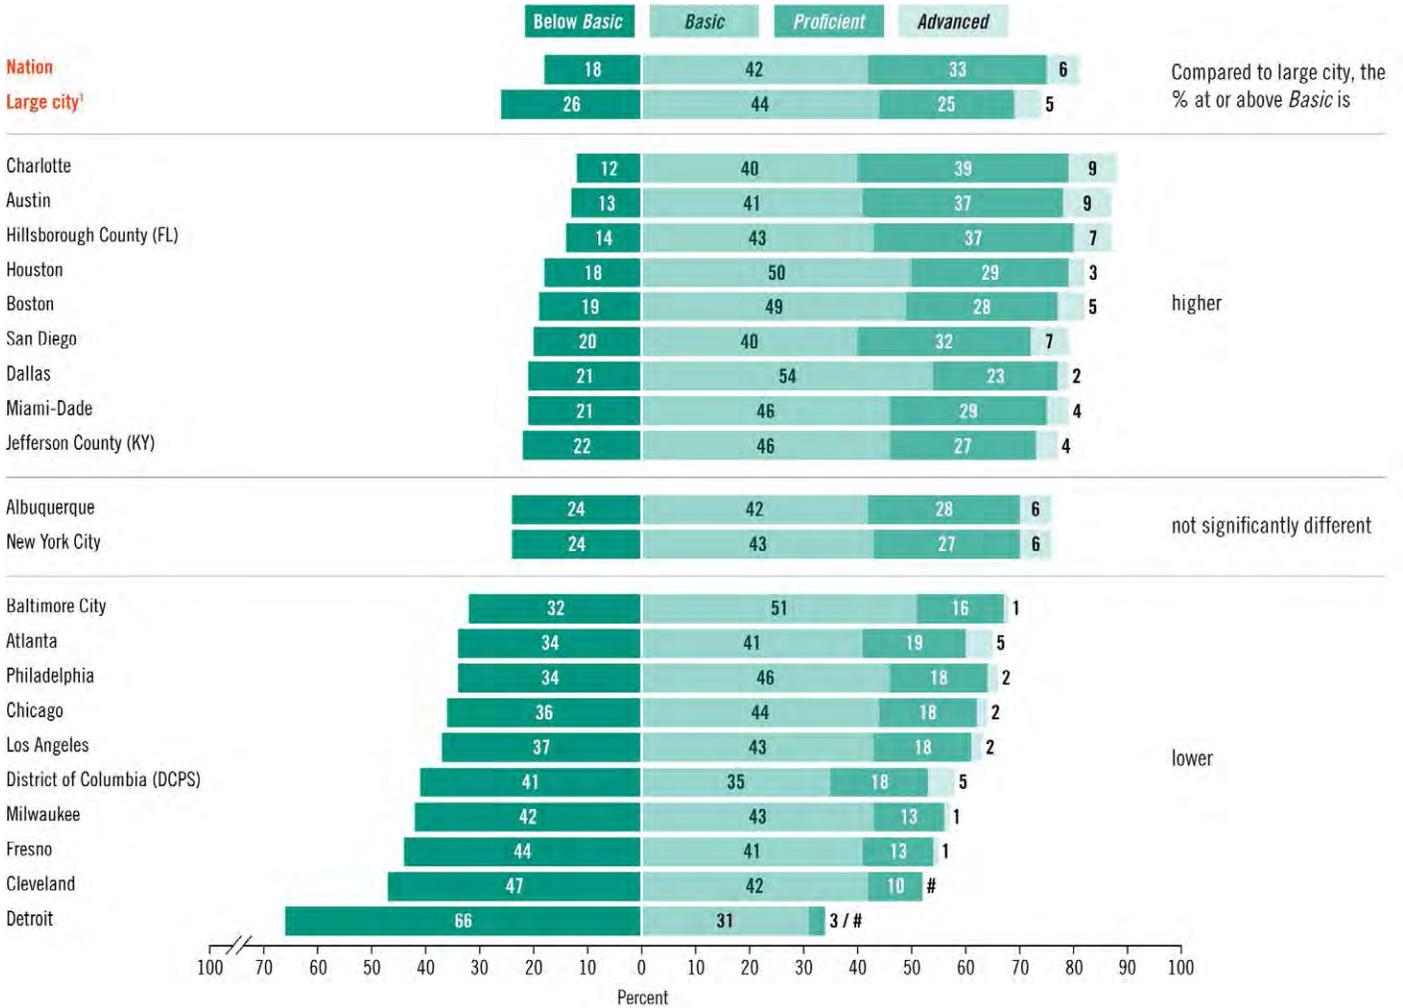

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. DCPS = District of Columbia Public Schools.

Districts show range of knowledge and skills

Among the 21 districts that participated in the 2011 assessment, the percentages of students performing at or above the *Basic* level ranged from 34 percent in Detroit to 88 percent in Charlotte (**figure 3**). All of the districts had some students performing at or above the *Proficient* level in 2011.

Nine districts had higher percentages of students at or above *Basic* than large cities. Eight of the districts also had higher average scores than large cities, while the overall average score for Dallas was not significantly different from large cities. The same 10 districts that scored lower than large cities also had lower percentages of students at or above *Basic*. The percentages of students at or above *Basic* in Albuquerque and New York City were not significantly different from the percentage for large cities.

Figure 3. Achievement-level results in NAEP mathematics for fourth-grade public school students, by jurisdiction: 2011

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Percentages of students at both *Proficient* and *Advanced* higher than in 2003 for seven districts

In comparison to 2003, the percentages of students performing below the *Basic* level were lower in 2011 for all but 1 of the 10 districts that participated in both years (there was no significant change in the percentage below *Basic* in Cleveland). Seven districts had higher percentages of students at *Proficient* and at *Advanced* (**figure 4**).

In comparison to 2009, the percentages of students performing below the *Basic* level were lower in 2011 for Jefferson County and Philadelphia, and higher in New York City. The percentages of students at *Proficient* were higher in Austin, Baltimore City, and the District of Columbia. Austin was the only one of the participating districts to have a higher percentage of students at *Advanced*.

Districts vary in demographic makeup

When comparing the results for urban districts to results for the nation and large cities, it is important to consider differences in demographic makeup. In the nation, the percentage of White fourth-graders was higher than the combined percentage of Black and Hispanic students in 2011. However, the opposite was true for large cities overall and for all but one of the 21 participating districts (**table 2**). Jefferson County was the only district where the percentage of White students was higher than the combined percentage of Black and Hispanic students.

Large cities and districts also differed from the nation in the proportion of students eligible for the National School Lunch Program (NSLP), an indicator of lower family income (see the Technical Notes for more information on eligibility criteria). Fifty-two percent of fourth-graders were eligible for free/reduced-price school lunch nationally compared to 74 percent in large cities. Charlotte was the only participating district where the percentage of eligible students was not significantly different from the percentage for the nation. The percentages of eligible students in the other districts were all higher than the nation—ranging from 58 percent in Hillsborough County to 100 percent in Cleveland, where all students were categorized as eligible.

Table 2. Selected characteristics of fourth-grade public school students in NAEP mathematics, by jurisdiction: 2011

Jurisdiction	Number of fourth-graders	Number of students assessed	Percentage of students						
			White	Black	Hispanic	Asian	Eligible for free/reduced-price school lunch	Students with disabilities	English language learners
Nation	3,614,000	198,900	52	16	24	5	52	12	11
Large city¹	604,000	50,600	20	27	43	7	74	11	22

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

² In Cleveland, all students were categorized as eligible for the National School Lunch Program.

NOTE: The number of fourth-graders is rounded to the nearest 1,000. The number of students assessed is rounded to the nearest 100. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin. The race/ethnicity categories listed may not sum to 100 percent because results are not shown for all racial/ethnic groups. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Large cities, in general, and some of the participating districts had higher percentages of English language learners (ELL) than the nation. The percentage of ELL students in large cities was 22 percent compared to 11 percent in the nation overall. The percentages of ELL students in Austin, Boston, Dallas, Fresno, Houston, Los Angeles, and San Diego were higher than the percentages in both the nation and large cities.

Although the data are not shown here, the proportions of students in these groups have also changed over time in some districts (see appendix **tables A-2, A-4, and A-8**). For example, among the districts that participated in 2003, Atlanta, Boston, Charlotte, Chicago, Cleveland, the District of Columbia, and Houston had smaller percentages of Black students in 2011 and larger percentages of Hispanic students. The percentages of students eligible for NSLP in 2011 were larger than in 2003 in Charlotte and Chicago. The percentages of ELL students were larger in 2011 than in 2003 in Boston, Charlotte, Cleveland, the District of Columbia, and New York City, and smaller in Los Angeles.

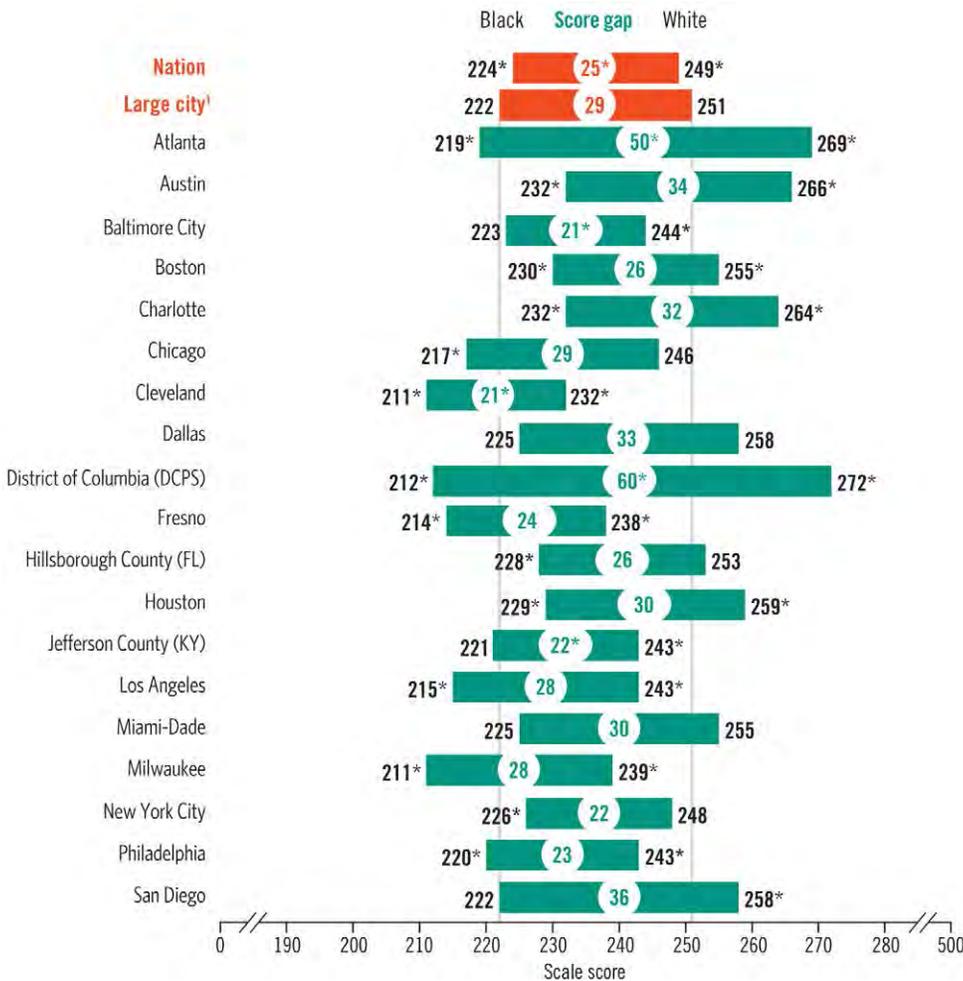

Compared to large cities overall, White – Black score gaps smaller in three districts and larger in two districts

Additional insight into the overall performance of participating districts can be obtained by examining how differences in the performance of student groups in the districts compare to differences in performance for those groups in large cities. In 2011, the 29-point score gap between White and Black fourth-graders in large cities was larger than the 25-point White – Black score gap for the nation (figure 5). The White – Black score gaps in the districts ranged from 21 points in Baltimore City and Cleveland to 60 points in the District of Columbia. (Note that sample sizes were too small to report results for Black students in Albuquerque or White students in Detroit.)

White – Black score gaps in Baltimore City, Cleveland, and Jefferson County were smaller than the score gap for large cities. In each of these districts, the score for White students was lower than the score for White students in large cities, and the score for Black students was either lower than or not significantly different from large cities.

White – Black score gaps in Atlanta and the District of Columbia were larger than the score gap for large cities. In both districts, scores for White students were higher than the score for White students in large cities, and scores for Black students were lower than the score for Black students in large cities.

Figure 5. Average scores and score gaps in NAEP mathematics for White and Black fourth-grade public school students, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.
¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: Black includes African American. Race categories exclude Hispanic origin. Score gaps are calculated based on differences between unrounded average scores. Sample sizes were insufficient to permit reliable estimates for Black students in Albuquerque and for White students in Detroit, so results are not shown for these two districts. DCPS = District of Columbia Public Schools.

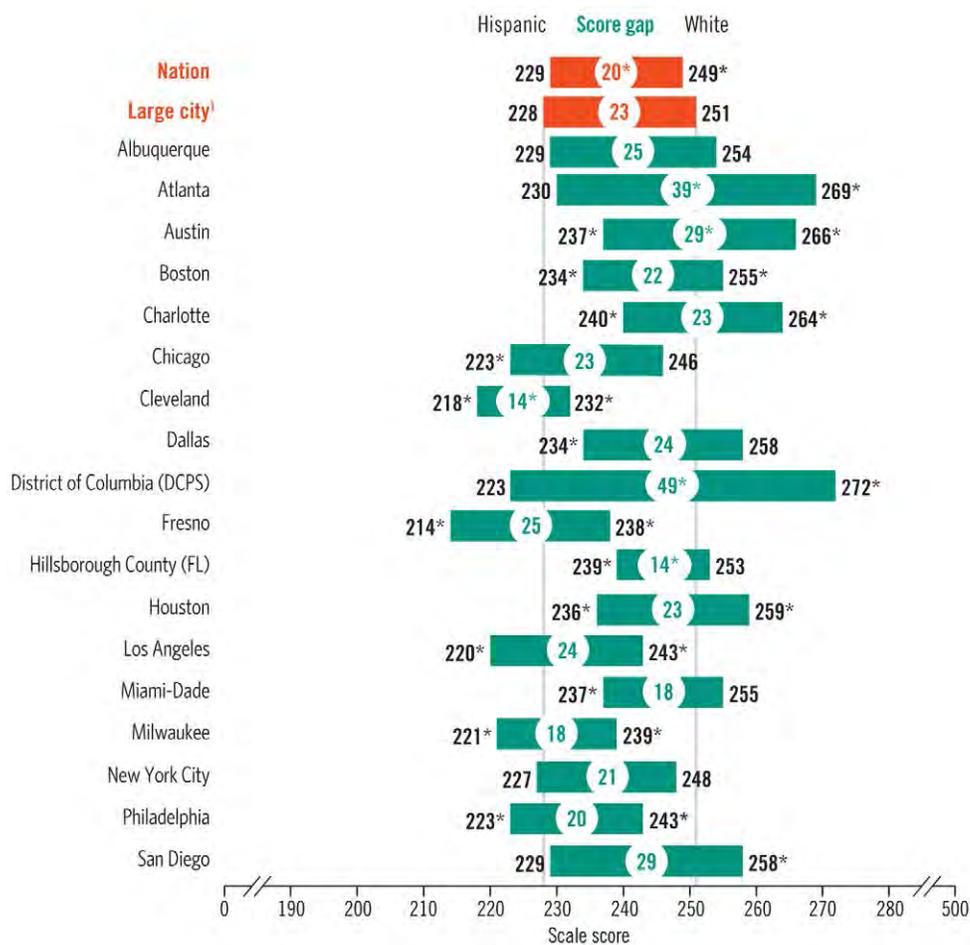

In comparison to large cities, White – Hispanic score gaps smaller in two districts and larger in three districts

White fourth-graders in large cities scored 23 points higher on average than Hispanic fourth-graders, which was larger than the 20-point White – Hispanic score gap for the nation. The White – Hispanic score gaps in the districts ranged from 14 points in Cleveland and Hillsborough County to 49 points in the District of Columbia (figure 6). The score-point difference between White and Hispanic students in Jefferson County was not found to be statistically significant. (Note that sample sizes were too small to report results for Hispanic students in Baltimore City or White students in Detroit.)

White – Hispanic score gaps in Cleveland and Hillsborough County were smaller than the score gap for large cities. In Hillsborough County, the score for Hispanic students was higher in comparison to the score for Hispanic students in large cities, while the score for White students was not significantly different from the score for White students in large cities. In Cleveland, scores for both White and Hispanic students were lower than the score for large cities.

White – Hispanic score gaps in Atlanta, Austin, and the District of Columbia were larger than the score gap for large cities, but not necessarily because Hispanic students in those districts were scoring significantly lower than their peers in large cities. In all three of the districts, scores for White students were higher than the score for White students in large cities. The score for Hispanic students in Austin was higher than the score for Hispanic students in large cities, and scores for Hispanic students in Atlanta and the District of Columbia were not significantly different from large cities.

Figure 6. Average scores and score gaps in NAEP mathematics for White and Hispanic fourth-grade public school students, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.
¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: White excludes students of Hispanic origin. Hispanic includes Latino. Score gaps are calculated based on differences between unrounded average scores. Sample sizes were insufficient to permit reliable estimates for Hispanic students in Baltimore City and for White students in Detroit, so results are not shown for these two districts. Results are also not shown for Jefferson County (KY) because the apparent score difference between White (243) and Hispanic (238) students was not statistically significant. DCPS = District of Columbia Public Schools.

White, Black, and Hispanic students in four districts score higher than in 2003

Scores for White, Black, and Hispanic fourth-graders in the nation were higher in 2011 than in 2003, and both the White – Black and White – Hispanic score gaps narrowed in comparison to 2003 (figure 7). Although scores for all three racial/ethnic groups in large cities were also higher in 2011 than in 2003, there were no significant changes in the score gaps.

Scores were higher in 2011 than in 2003 for White, Black, and Hispanic students in Boston, Chicago, the District of Columbia, and San Diego. Scores were higher in 2011 for two of the groups in Charlotte, Houston, and New York City, and one group in Atlanta and Los Angeles. Even with higher scores for some racial/ethnic groups, neither the White – Black nor White – Hispanic score gap narrowed in any of the districts. The White – Black score gap widened from 2003 to 2011 in San Diego where the gain for White students was larger than for Black students.

Although not shown in the figure, Jefferson County was the only one of the districts participating in 2009 to have higher scores in 2011 for Black and Hispanic students. In addition, the White – Hispanic gap in Jefferson County narrowed in comparison to 2009 (see the district profile for Jefferson County presented later in this report).

Figure 7. Changes between 2003 and 2011 NAEP mathematics average scores and score gaps for fourth-grade public school students, by selected racial/ethnic groups and jurisdiction

Jurisdiction	All students	Race/ethnicity			Score gap	
		White	Black	Hispanic	White – Black	White – Hispanic
Nation	▲	▲	▲	▲	Narrowed	Narrowed
Large city¹	▲	▲	▲	▲	◆	◆
Atlanta	▲	◆	▲	‡	◆	‡
Boston	▲	▲	▲	▲	◆	◆
Charlotte	▲	▲	◆	▲	◆	◆
Chicago	▲	▲	▲	▲	◆	◆

District of Columbia (DCPS)	▲	▲	▲	▲	◆	◆
Houston	▲	◆	▲	▲	◆	◆
Los Angeles	▲	◆	◆	▲	◆	◆
New York City	▲	◆	▲	▲	◆	◆
San Diego	▲	▲	▲	▲	Widened	◆

▲ Higher in 2011.

◆ Not significantly different from 2011.

‡ Reporting standards not met. Sample size insufficient to permit a reliable estimate.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Included in the overall results but not shown separately are students whose race/ethnicity was Asian/Pacific Islander, American Indian/Alaska Native, unclassified, or two or more races. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin. DCPS = District of Columbia Public Schools.

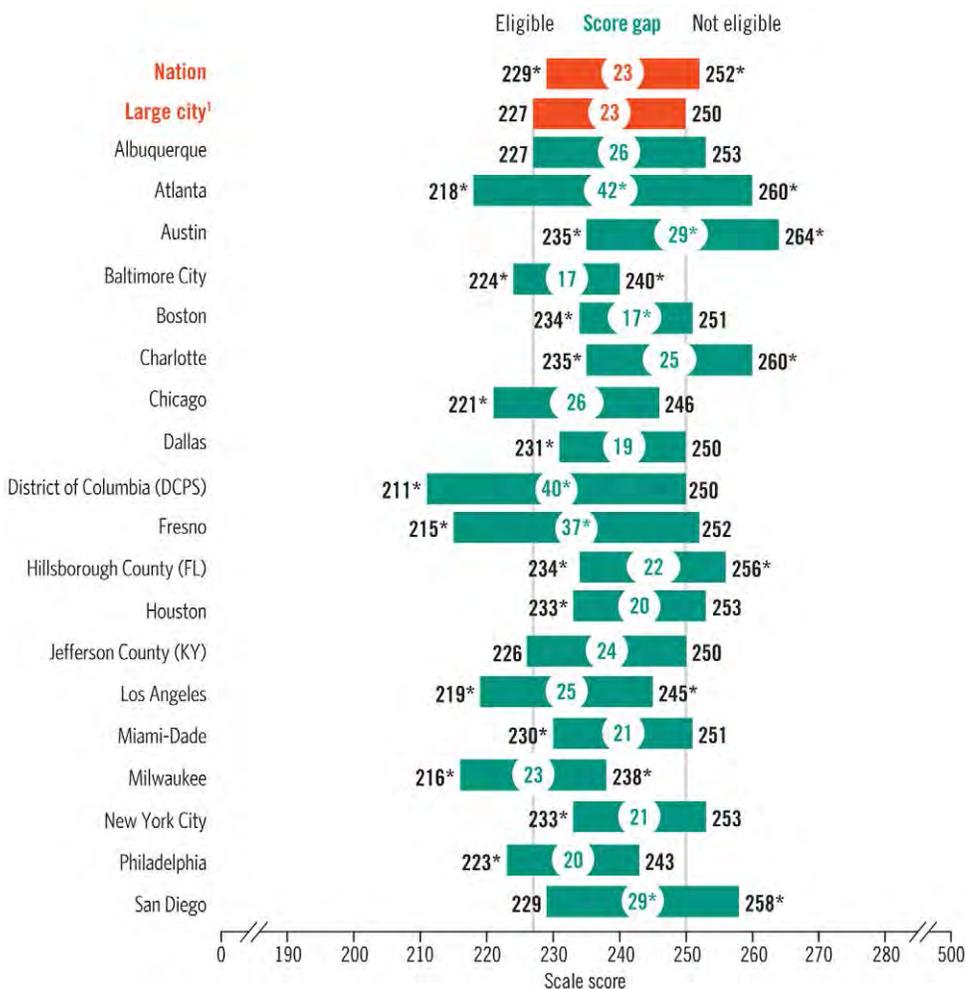

In comparison to large cities, score gaps between higher- and lower-income students are smaller in one district and larger in five districts

In 2011, the average score for students who were eligible for NSLP (lower-income students) was 23 points lower than the score for students who were not eligible (higher-income students) in both the nation and large cities (figure 8). The score gaps between higher- and lower-income students in the districts ranged from 17 points in Baltimore City and Boston to 42 points in Atlanta. The six-point score difference between the two groups in Detroit was not found to be statistically significant.

Boston was the only one of the 21 districts participating in 2011 to have a smaller score gap between higher- and lower-income students in comparison to the score gap for large cities overall. The score for lower-income students in Boston was higher than the score for large cities, and the score for higher-income students in the district was not significantly different from large cities.

The score gaps between higher- and lower-income students in Atlanta, Austin, the District of Columbia, Fresno, and San Diego were larger than the score gap for large cities overall. In Atlanta, the District of Columbia, and Fresno, the scores for lower-income students were lower than the score for large cities, and the scores for higher-income students were either higher than or not significantly different from large cities. But not all of the larger gaps were associated with lower scores for lower-income students. In Austin, the scores for higher- and lower-income students were both higher than the scores for their peers in large cities. In San Diego, the score for lower-income students was not significantly different from the score for large cities, and the score for higher-income students was higher than the score for large cities.

Figure 8. Average scores and score gaps in NAEP mathematics for fourth-grade public school students eligible and not eligible for free/reduced-price school lunch, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts. NOTE: Score gaps are calculated based on differences between unrounded average scores. In Cleveland, all students were categorized as eligible for the National School Lunch Program (NSLP). Therefore, a score gap comparison between students eligible and not eligible for NSLP could not be shown for this district. Results are also not shown for Detroit because the apparent score difference between not eligible (208) and eligible (203) students was not statistically significant. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Both higher- and lower-income students in seven districts score higher than in 2003

Scores for higher- and lower-income students in the nation and large cities were higher in 2011 than in 2003; however, there were no significant changes in the score gaps (figure 9).

Scores were higher in 2011 than in 2003 for both higher-income and lower-income students in seven of the nine districts where results could be reported for both groups. Even with higher scores for lower-income students in most of the participating districts, none of the districts had a smaller score gap between higher- and lower-income students in 2011 than in 2003, and the gaps widened in the District of Columbia and San Diego.

Although not shown here, the score gap between higher- and lower-income students in Fresno widened from 2009 to 2011, even though the average score did not change significantly from 2009 for either group.

Figure 9. Changes between 2003 and 2011 NAEP mathematics average scores and score gaps for fourth-grade public school students, by eligibility for free/reduced-price school lunch and jurisdiction

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Included in the overall results but not shown separately are students whose eligibility status for the National School Lunch Program was not available. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 and 2011 Mathematics Assessments.

Teacher education and experience vary across the 21 participating urban districts

As part of the 2011 fourth-grade NAEP assessment, questionnaires were completed by the teachers of participating students. Teachers were asked questions about their background, education, and training, and about classroom organization and instruction. Teachers' responses to these questions help provide some additional context for interpreting district results. Although the information was provided by the teachers, the results are reported as the percentages of students whose teachers provided a particular response.

Seven percent of fourth-grade public school students in the nation had teachers who reported having a major, minor, or special emphasis in mathematics as part of their undergraduate coursework, which was not significantly different from the percentage for large cities (**table 3**). Among the 21 participating districts, the percentages of students whose teachers had a major or minor in mathematics ranged from 3 percent in Fresno, Hillsborough County, and San Diego to 26 percent in Detroit.

Forty-eight percent of students in both the nation and large cities had teachers who reported the highest academic degree they held was a master's. The percentages of students in the districts whose teachers had a master's degree ranged from 25 percent in Fresno to 84 percent in New York City.

Although there was no significant difference in the percentages of students in the nation and large cities who were taught by teachers with four or less years of experience as an elementary or secondary school teacher, the percentages in the participating districts ranged from 2 percent in Cleveland to 37 percent in Baltimore City. A higher percentage of students in the nation than in large cities had teachers with 20 or more years of teaching experience, with the percentages in the districts ranging from 13 percent in Baltimore City and Hillsborough County to 46 percent in Cleveland.

Table 3. Percentage of fourth-grade public school students assessed in NAEP mathematics, by teachers' educational background, years of teaching experience, and jurisdiction: 2011

Jurisdiction	Educational background		Years of teaching experience	
	Undergraduate emphasis in mathematics ¹	Master's degree	4 or less years	20 or more years
Nation	7	48	16	24
Large city²	8	48	18	19
Albuquerque	8	37	17	15
Atlanta	10	53	18	16
Austin	9	28	25	17
Baltimore City	10	48	37	13
Boston	13	75	18	20
Charlotte	7	39	31	17
Chicago	15	61	16	21
Cleveland	8	75	2	46
Dallas	19	43	18	21
Detroit	26	67	6	32
District of Columbia (DCPS)	12	52	30	24
Fresno	3	25	4	28
Hillsborough County (FL)	3	32	27	13
Houston	16	28	24	17
Jefferson County (KY)	7	56	28	24
Los Angeles	6	39	4	19
Miami-Dade	5	48	12	20
Milwaukee	10	55	11	27
New York City	9	84	15	15
Philadelphia	7	59	18	21
San Diego	3	73	3	22

¹ Teachers reported having a major, minor, or special emphasis as part of their undergraduate coursework.

² Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Results are not shown for the other levels of educational background and years of experience reported by teachers. DCPS = District of Columbia Public Schools.

Explore Additional Results

Results for other background questions from the fourth-grade student, teacher, and school questionnaires are available in the NAEP Data Explorer at <http://nces.ed.gov/nationsreportcard/naepdata/>.

Assessment Content at Grade 4

Additional insight into students' performance on the NAEP mathematics assessment can be obtained by examining what fourth-graders are expected to know and be able to do and how they performed on some of the assessment questions designed to measure their knowledge and skills.

Mathematics Achievement-Level Descriptions for Grade 4

NAEP mathematics achievement-level descriptions outline expectations of student performance at each grade. The specific descriptions of what fourth-graders should know and be able to do at the *Basic*, *Proficient*, and *Advanced* mathematics achievement levels are presented below. (Note that the shaded text is a short, general summary to describe performance at each achievement level.)

NAEP achievement levels are cumulative; therefore, students performing at the *Proficient* level also display the competencies associated with the *Basic* level, and students at the *Advanced* level also demonstrate the skills and knowledge associated with both the *Basic* and the *Proficient* levels. The cut score indicating the lower end of the score range for each level is noted in parentheses.

Basic (214)

Fourth-grade students performing at the *Basic* level should show some evidence of understanding the mathematical concepts and procedures in the five NAEP content areas.

Fourth-graders performing at the *Basic* level should be able to estimate and use basic facts to perform simple computations with whole numbers; show some understanding of fractions and decimals; and solve some simple real-world problems in all NAEP content areas. Students at this level should be able to use—although not always accurately—four-function calculators, rulers, and geometric shapes. Their written responses are often minimal and presented without supporting information.

Proficient (249)

Fourth-grade students performing at the *Proficient* level should consistently apply integrated procedural knowledge and conceptual understanding to problem solving in the five NAEP content areas.

Fourth-graders performing at the *Proficient* level should be able to use whole numbers to estimate, compute, and determine whether results are reasonable. They should have a conceptual understanding of fractions and decimals; be able to solve real-world problems in all NAEP content areas; and use four-function calculators, rulers, and geometric shapes appropriately. Students performing at the *Proficient* level should employ problem-solving strategies such as identifying and using appropriate information. Their written solutions should be organized and presented both with supporting information and explanations of how they were achieved.

Advanced (282)

Fourth-grade students performing at the *Advanced* level should apply integrated procedural knowledge and conceptual understanding to complex and nonroutine real-world problem solving in the five NAEP content areas.

Fourth-graders performing at the *Advanced* level should be able to solve complex nonroutine real-world problems in all NAEP content areas. They should display mastery in the use of four-function calculators, rulers, and geometric shapes. These students are expected to draw logical conclusions and justify answers and solution processes by explaining why, as well as how, they were achieved. They should go beyond the obvious in their interpretations and be able to communicate their thoughts clearly and concisely.

What Fourth-Graders Know and Can Do in Mathematics

The item map below is useful for understanding performance at different levels on the NAEP scale. The scale scores on the left represent the scores for students who were likely to get the items correct or complete. The cut score at the lower end of the range for each achievement level is boxed. The descriptions of selected assessment questions indicating what students need to do to answer the question correctly, along with the corresponding mathematics content areas, are listed on the right.

For example, the map on this page shows that fourth-graders performing at the *Basic* level with a score of 216 were likely to be able to determine the measurements needed for computing area. Students performing at the *Proficient* level with a score of 279 were likely to be able to recognize and extend an algebraic pattern. Students performing at the *Advanced* level with a score of 290 were likely to be able to compare two sets of data presented graphically.

GRADE 4 NAEP MATHEMATICS ITEM MAP

Scale score	Content area	Question description
500		
///		
Advanced		
330	Number properties and operations	Compose numbers using place value to determine winners of a game
317	Geometry	Divide a square into various shapes
293	Measurement	Solve a story problem involving time (calculator available) (shown on pages 26 and 27)
291	Algebra	<i>Identify the growth relationship from a table</i> (calculator available)
290	Data analysis, statistics, and probability	<i>Compare two sets of data using graphs</i>
282		
279	Algebra	<i>Recognize and extend a growing pattern</i>
278	Number properties and operations	Order fractions with unlike denominators
276	Measurement	Draw a line segment of a given length
275	Number properties and operations	Use place value to determine the total amount
269	Geometry	<i>Compare simple figures to identify a common property</i> (shown on page 25)
261	Number properties and operations	Identify and use factors to solve a problem in context (calculator available)
259	Number properties and operations	<i>Use place value to find a sum</i>
254	Data analysis, statistics, and probability	Create a pictograph of a set of data (calculator available)
250	Measurement	<i>Find areas of a scale drawing on a grid</i>
249		
243	Algebra	Label sections on a grid from a list of coordinates
240	Number properties and operations	<i>Determine the sum of numbers represented on a number line</i> (calculator available)
239	Number properties and operations	Explain a property of divisibility
232	Number properties and operations	<i>Compute the difference of two 4-digit numbers</i> (shown on page 24)
230	Number properties and operations	<i>Solve a story problem involving division</i> (calculator available)
226	Data analysis, statistics, and probability	<i>Identify the most likely outcome from a given spinner</i> (calculator available)
221	Geometry	<i>Describe a real-world object in terms of a geometric solid</i>
216	Measurement	<i>Identify measurements needed to determine area</i>
214		
211	Number properties and operations	<i>Compute the difference of fractions with like denominators</i>
195	Algebra	<i>Determine numerical value of an unknown quantity in a whole number sentence</i>
180	Geometry	<i>Identify a figure that is not symmetric</i> (calculator available)
175	Measurement	<i>Identify the appropriate measuring device for a given attribute</i>
///		
0		
Basic		

NOTE: Regular type denotes a constructed-response question. *Italic* type denotes a multiple-choice question. The position of a question on the scale represents the scale score attained by students who had a 65 percent probability of successfully answering a constructed-response question, or a 74 percent probability of correctly answering a four-option multiple-choice question. For constructed-response questions, the question description represents students' performance rated as completely correct. Scale score ranges for mathematics achievement levels are referenced on the map.

Mathematics Content Area: Number Properties and Operations

Subtract:

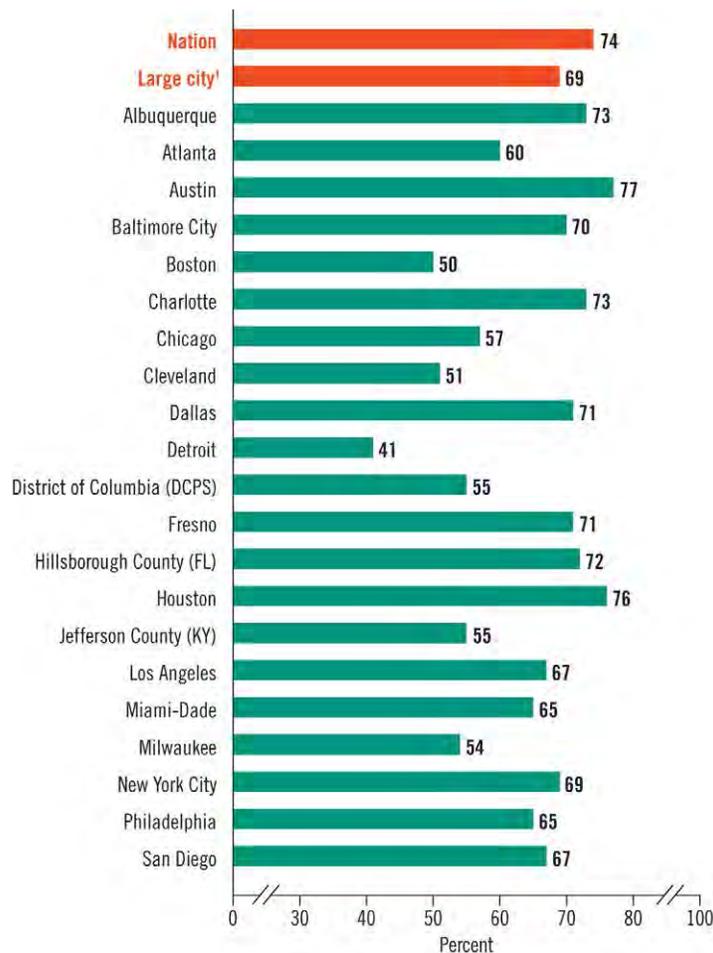

$$\begin{array}{r} 6,090 \\ - 4,843 \\ \hline \end{array}$$

- (A) 1,147
- (B) 1,247
- (C) 2,257
- (D) 2,853

This multiple-choice question from the 2011 mathematics assessment asks students to answer a subtraction problem involving two 4-digit numbers. The problem requires students to regroup twice to obtain the correct answer of 1,247 (Choice B). Students were not permitted to use a calculator to answer this question.

Seventy-four percent of fourth-grade public school students in the nation selected the correct answer to this question. The percentage of correct responses in each of the TUDA districts ranged from 41 percent in Detroit to 77 percent in Austin.

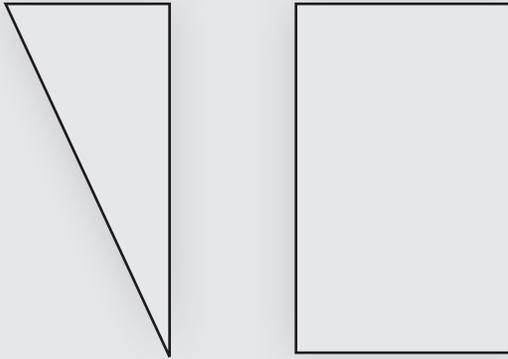

Percentage correct for fourth-grade public school students, by jurisdiction: 2011

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
NOTE: DCPS = District of Columbia Public Schools.

Mathematics Content Area: Geometry

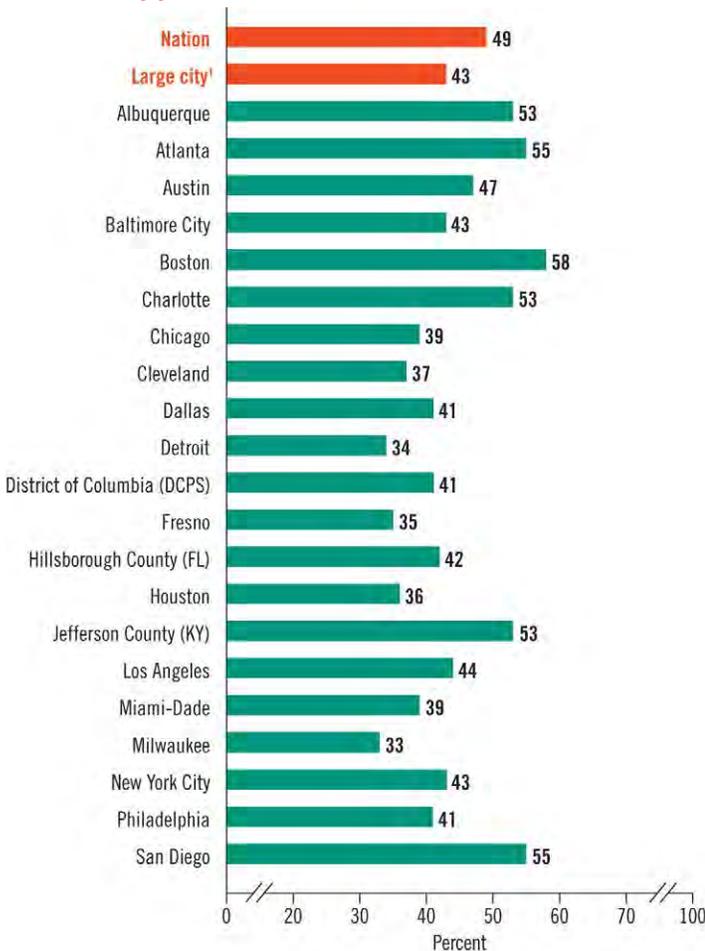

How are the right triangle and the rectangle alike?

- A Each figure has at least one right angle.
- B Each figure has parallel sides.
- C Each figure has at least one line of symmetry.
- D Each figure has at least two sides that are the same length.

This multiple-choice question measures student performance in the geometry content area. The question asks students to compare two geometric figures—a right triangle and a rectangle—and identify a property common to both figures. The correct answer is that each figure has at least one right angle (Choice A). Students were not permitted to use a calculator on this question.

Forty-nine percent of fourth-grade public school students in the nation selected the correct answer to this question. The percentage of correct responses in each of the TUDA districts ranged from 33 percent in Milwaukee to 58 percent in Boston.

Percentage correct for fourth-grade public school students, by jurisdiction: 2011

Mathematics Content Area: Measurement

MOVIE TIMES

Early Show 3:15

Late Show 7:30

The early show and the late show for a movie last the same amount of time. The early show begins at 3:15 P.M. and ends at 4:27 P.M. The late show begins at 7:30 P.M. At what time does the late show end?

Show your work.

This short constructed-response question measures fourth-graders' ability to perform computations using units of time. The first step requires students to determine the length of the movie from the starting and ending times of the early show. The second step requires that they add that length of time to the starting time of the late show. Students were permitted to use a calculator to solve this question. Responses were rated using three scoring levels.

Correct responses gave an answer of 8:42 for the ending time of the late show and provided supporting work, which included either showing a computation for determining the length of the movie from the times of the early show ($4:27 - 3:15 = 1:12$, "1 hour and 12 minutes"), or showing the addition of 1:12 to 7:30.

Partial responses did one of the following:

- Gave an answer of 8:42 with no work or incorrect work,
- Determined the length of the movie (1 hour and 12 minutes) but did not answer 8:42, or
- Incorrectly determined the length of the movie but correctly used that time to determine the ending time of the late show.

Incorrect responses gave an incorrect end time for the late show.

The student response shown below was rated as "Correct" because it provided the correct answer with supporting work. Thirty-one percent of fourth-grade public school students in the nation gave responses to this question that received a rating of "Correct."

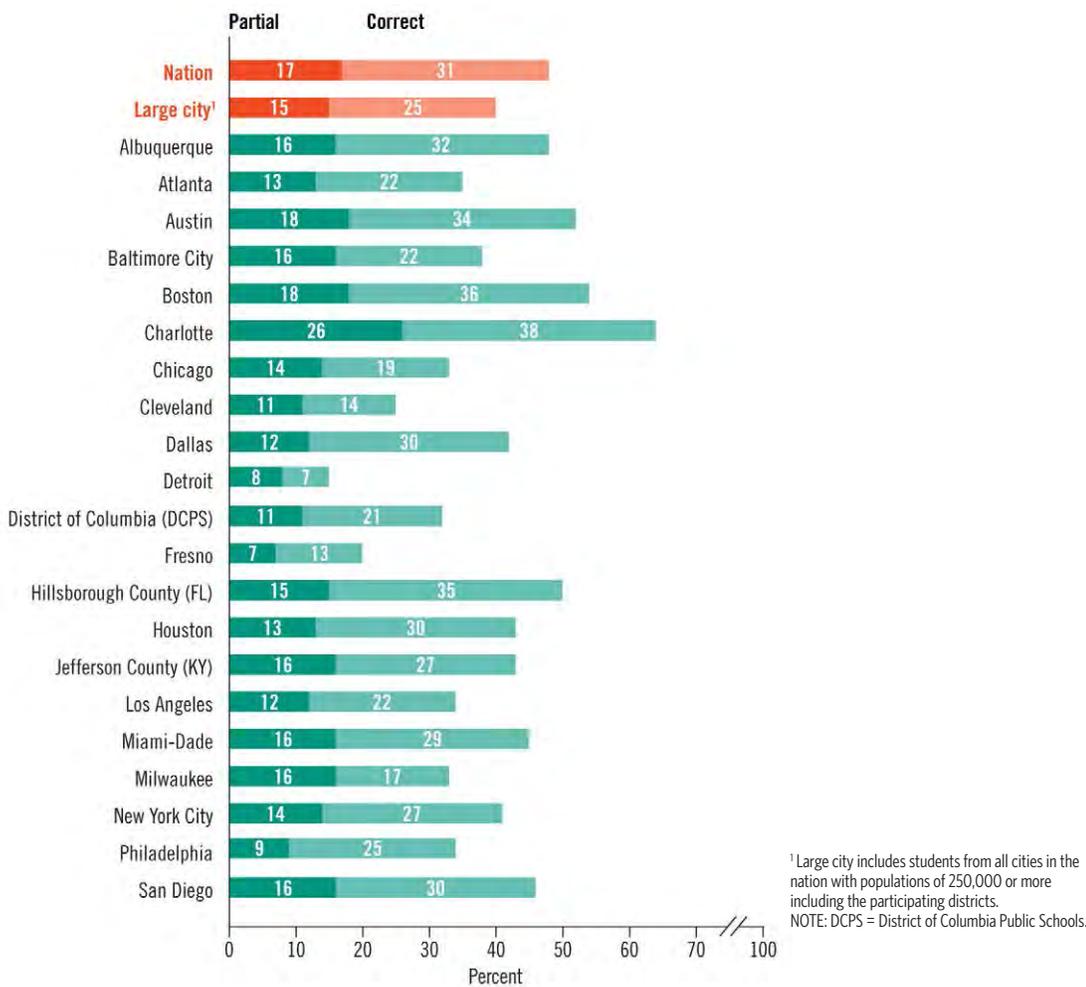

$$\begin{array}{r} 4:27 \\ - 3:15 \\ \hline 1:12 \end{array}$$
$$\begin{array}{r} 7:30 \\ + 1:12 \\ \hline 8:42 \end{array}$$

The student response shown below was rated as “Partial” because the ending time of the late show was correctly determined based on an incorrect time for the length of the movie. Seventeen percent of fourth-grade public school students gave responses to this question that received a rating of “Partial” for one of the reasons described on the previous page.

$$\begin{array}{r}
 3:15 \text{ to } 4:27 = 1:32 \\
 \begin{array}{r}
 4:27 \\
 - 3:15 \\
 \hline
 1:32 \\
 \end{array} \\
 \begin{array}{r}
 7:36 \\
 + 1:32 \\
 \hline
 9:02 \\
 \end{array}
 \end{array}$$

The percentages of student responses rated “Correct” and “Partial” are presented below for large city and participating TUDA districts.

Percentage of answers rated as “Partial” and “Correct” for fourth-grade public school students, by jurisdiction: 2011

Explore Additional Sample Questions and Data

Additional sample questions from the NAEP mathematics assessment can be found in the NAEP Questions Tool (NQT) at <http://nces.ed.gov/nationsreportcard/itmrlsx/landing.aspx>.

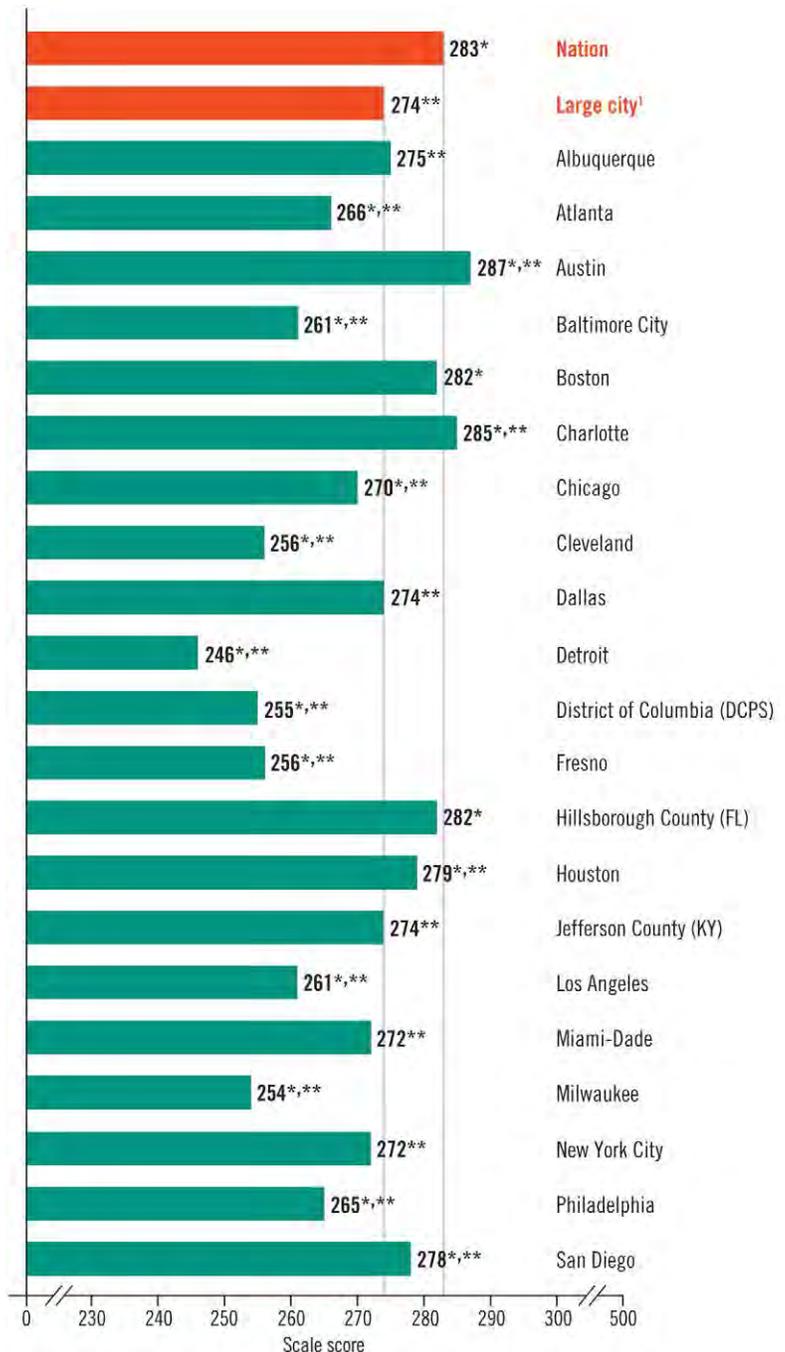

The NQT makes it possible to search for questions by subject, grade, difficulty, and other characteristics. You can view questions, scoring guides, sample student responses, and performance data, as well as create customized reports.

Two districts score higher than both the national average and large cities overall

In 2011, the average mathematics score for eighth-graders attending public schools in large cities was 9 points lower than the score for public school students in the nation (figure 10). Scores for 2 of the 21 participating districts were higher than the scores for both the nation and large cities overall, and scores for 10 districts were lower than both the nation and large cities.

- Scores for Austin and Charlotte were higher than the scores for both the nation and large cities.
- The scores for Boston and Hillsborough County were not significantly different from the score for the nation but were higher than the score for large cities.
- Scores for Houston and San Diego were lower than the national average but higher than the score for large cities.
- Scores for Albuquerque, Dallas, Jefferson County, Miami-Dade, and New York City were lower than the nation but not significantly different from large cities.
- Scores were lower than both the nation and large cities in Atlanta, Baltimore City, Chicago, Cleveland, Detroit, the District of Columbia, Fresno, Los Angeles, Milwaukee, and Philadelphia.

Figure 10. Average scores in NAEP mathematics for eighth-grade public school students, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.
 ** Significantly different ($p < .05$) from the nation.
¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: DCPS = District of Columbia Public Schools.

Nine districts score higher than in 2003, and six score higher than in 2009

Of the 21 districts that participated in the 2011 mathematics assessment, 18 participated in 2009, and 10 participated in the first TUDA assessment in 2003. The results from earlier assessments make it possible to examine how the performance for students overall and for student groups in those districts has changed over time. Some of the results summarized here are provided in more detail in the profiles for each district presented later in this report.

In comparison to 2003, average mathematics scores were higher in 2011 for eighth-graders in the nation and in large cities (figure 11). Scores were also higher in 2011 than in 2003 for all of the districts that participated both years with one exception—there was no significant change in the score for Cleveland.

In comparison to 2009, scores were higher in 2011 for Atlanta, Charlotte, Chicago, Detroit, the District of Columbia, and Jefferson County and did not change significantly in the other 12 districts that participated in both years.

Figure 11. Changes in 2011 NAEP mathematics average scores from 2003 and 2009 for eighth-grade public school students, by jurisdiction

- ▲ Higher in 2011.
- ◆ Not significantly different from 2011.
- District did not participate.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. DCPS = District of Columbia Public Schools.

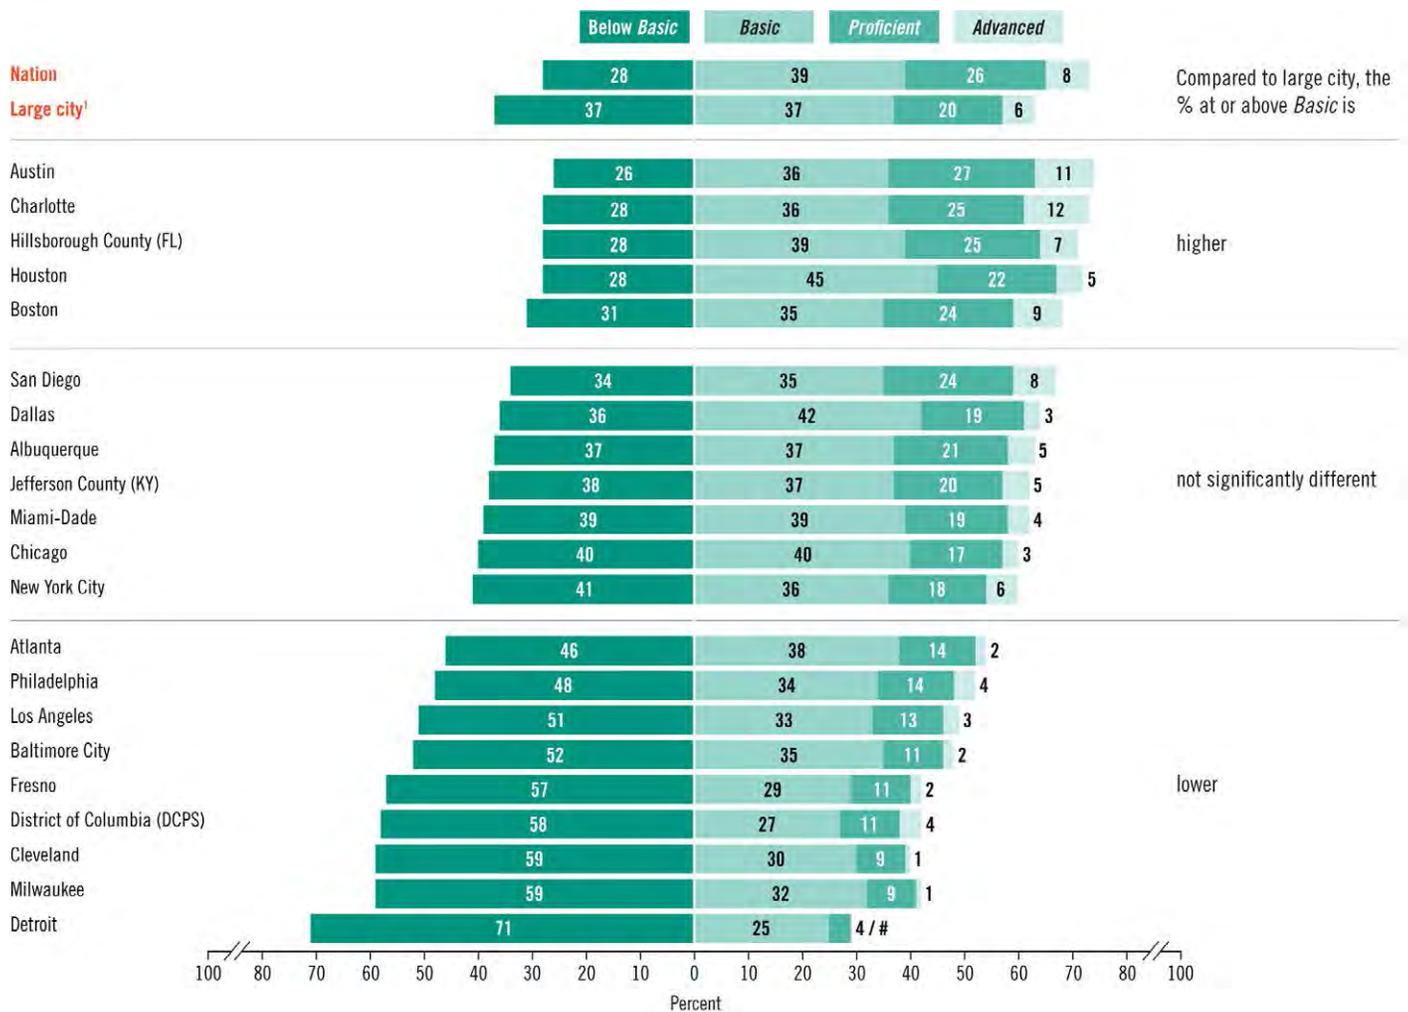

Districts show range of knowledge and skills

Among the 21 districts that participated in the 2011 assessment, the percentages of students performing at or above the *Basic* level ranged from 29 percent in Detroit to 74 percent in Austin (figure 12). All of the districts had some students performing at or above the *Proficient* level in 2011.

Among the six districts where average scores were higher than the score for large cities overall, five also had higher percentages of students at or above *Basic*. Although the average score in San Diego was higher than the score for large cities, the percentage of students at or above *Basic* in San Diego was not found to be statistically different from the percentage for large cities.

Among the 10 districts that scored lower than large cities overall, 9 had lower percentages of students at or above *Basic*. The percentage of students at or above *Basic* in Chicago was not significantly different from the percentage for large cities.

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Percentages of students at both *Proficient* and *Advanced* higher than in 2003 for six districts

In comparison to 2003, the percentages of students performing below the *Basic* level were lower in 2011 for all but 1 of the 10 districts that participated in both years (there was no significant change in the percentage below *Basic* in Cleveland). Six districts had higher percentages of students at *Proficient* and at *Advanced* (figure 13).

In comparison to 2009, the percentages of students in Atlanta and Chicago performing below the *Basic* level were lower in 2011, and the percentages at *Proficient* were higher. Charlotte was the only one of the participating districts to have a higher percentage of students at *Advanced*.

Districts vary in demographic makeup

When comparing the results for urban districts to results for the nation and large cities, it is important to consider differences in demographic makeup. In the nation, the percentage of White eighth-graders was higher than the combined percentage of Black and Hispanic students in 2011. However, the opposite was true for large cities overall and for all but one of the 21 participating districts (**table 4**). Jefferson County was the only district where the percentage of White students was higher than the combined percentage of Black and Hispanic students.

Large cities and districts also differed from the nation in the proportion of students eligible for the National School Lunch Program (NSLP), an indicator of lower family income. Forty-eight percent of eighth-graders were eligible for NSLP nationally compared to 70 percent in large cities. The percentage of eligible students in every one of the participating districts was higher than the percentage for the nation—ranging from 52 percent in Charlotte to 100 percent in Cleveland, where all students were categorized as eligible.

Table 4. Selected characteristics of eighth-grade public school students in NAEP mathematics, by jurisdiction: 2011

Jurisdiction	Number of eighth-graders	Number of students assessed	Percentage of students						
			White	Black	Hispanic	Asian	Eligible for free/reduced-price school lunch	Students with disabilities	English language learners
Nation	3,508,000	164,400	54	16	23	5	48	11	6
Large city¹	562,000	41,500	20	26	43	8	70	11	11

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

² In Cleveland, all students were categorized as eligible for the National School Lunch Program.

NOTE: The number of eighth-graders is rounded to the nearest 1,000. The number of students assessed is rounded to the nearest 100. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin. The race/ethnicity categories listed may not sum to 100 percent because results are not shown for all racial/ethnic groups. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Large cities, in general, and some of the participating districts had higher percentages of English language learners (ELL) than the nation. The percentage of ELL students in large cities was 11 percent compared to 6 percent in the nation overall. The percentages of ELL students in Austin, Boston, Dallas, Fresno, and Los Angeles were higher than the percentages in both the nation and large cities.

Although the data are not shown here, the proportions of students in these groups have also changed over time in some districts (see appendix **tables A-2, A-4, and A-8**). For example, among the 10 districts that participated in 2003, Atlanta, Boston, Cleveland, the District of Columbia, Houston, and San Diego had smaller percentages of Black students in 2011. Atlanta, Boston, Charlotte, the District of Columbia, and Houston had larger percentages of Hispanic students in 2011 than in 2003. The percentages of students eligible for NSLP were larger in 2011 than in 2003 in Atlanta, Boston, Charlotte, the District of Columbia, Houston, Los Angeles, and San Diego. The percentages of ELL students were larger in 2011 than in 2003 in Boston, Cleveland, and the District of Columbia, and smaller in Los Angeles and San Diego.

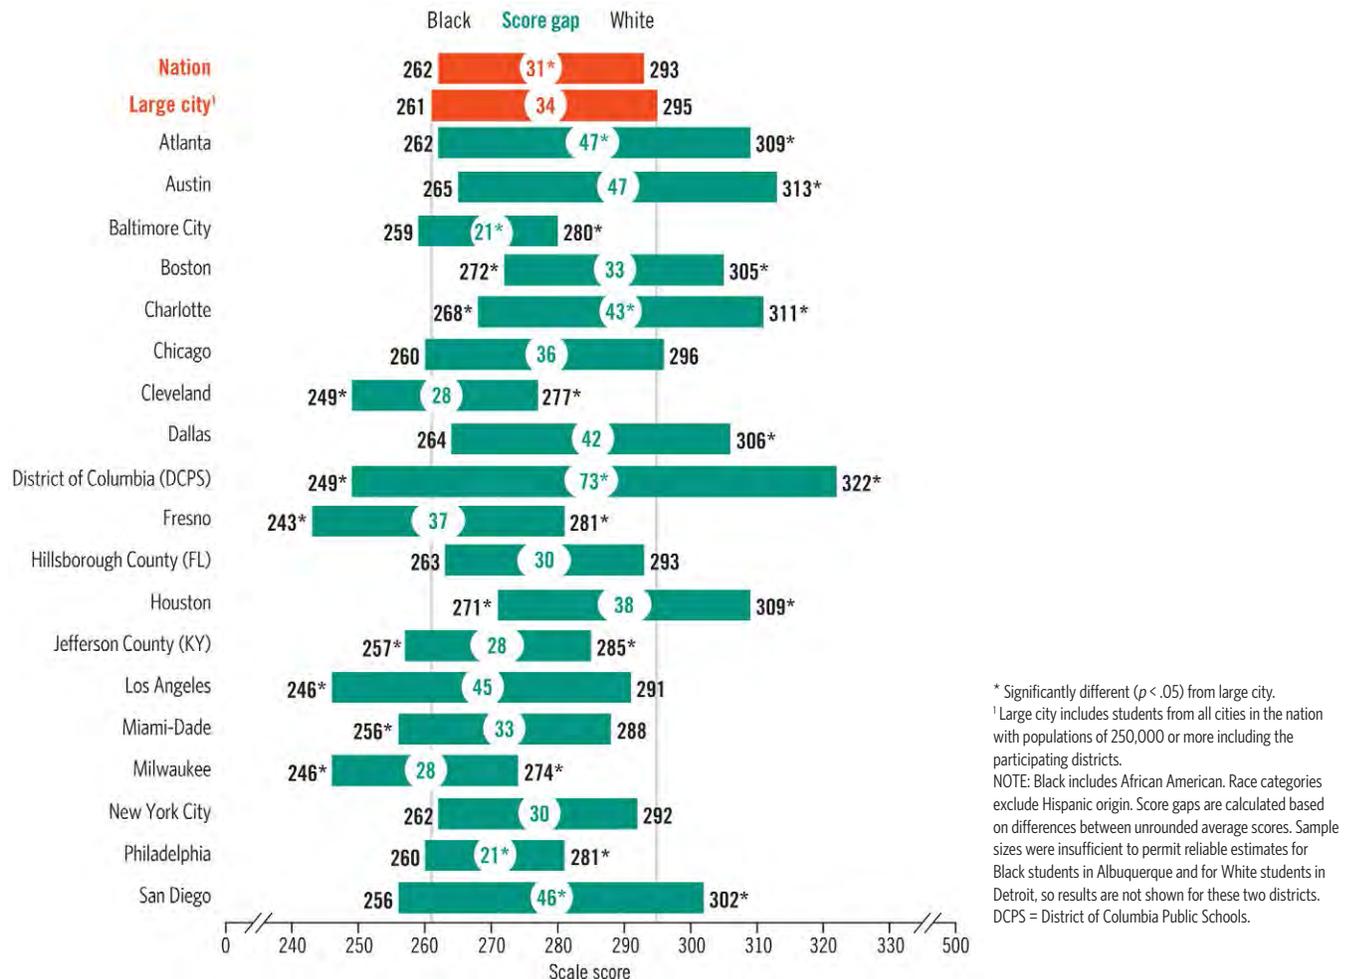

Compared to large cities overall, White – Black score gaps smaller in two districts and larger in four districts

Examining how student groups in the districts performed in comparison to their peers in large cities provides some additional context for the overall district results. In 2011, the 34-point score gap between White and Black eighth-graders in large cities was larger than the 31-point White – Black score gap for the nation (figure 14). The White – Black score gaps in the districts ranged from 21 points in Baltimore City and Philadelphia to 73 points in the District of Columbia. (Note that sample sizes were too small to report results for Black students in Albuquerque or White students in Detroit.)

White – Black score gaps in Baltimore City and Philadelphia were smaller than the score gap for large cities. In each of these districts, the score for White students was lower than the score for White students in large cities, and the score for Black students was not significantly different from large cities.

White – Black score gaps in Atlanta, Charlotte, the District of Columbia, and San Diego were larger than the score gap for large cities. In the District of Columbia, the score for White students was higher than the score for White students in large cities, and the score for Black students was lower than the score for Black students in large cities. But not all of the districts with a larger White – Black score gap than large cities had a lower score for Black students. In Atlanta, Charlotte, and San Diego, the average scores for White students were higher than the score for White students in large cities, and the scores for Black students were either higher than or not significantly different from large cities.

Figure 14. Average scores and score gaps in NAEP mathematics for White and Black eighth-grade public school students, by jurisdiction: 2011

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

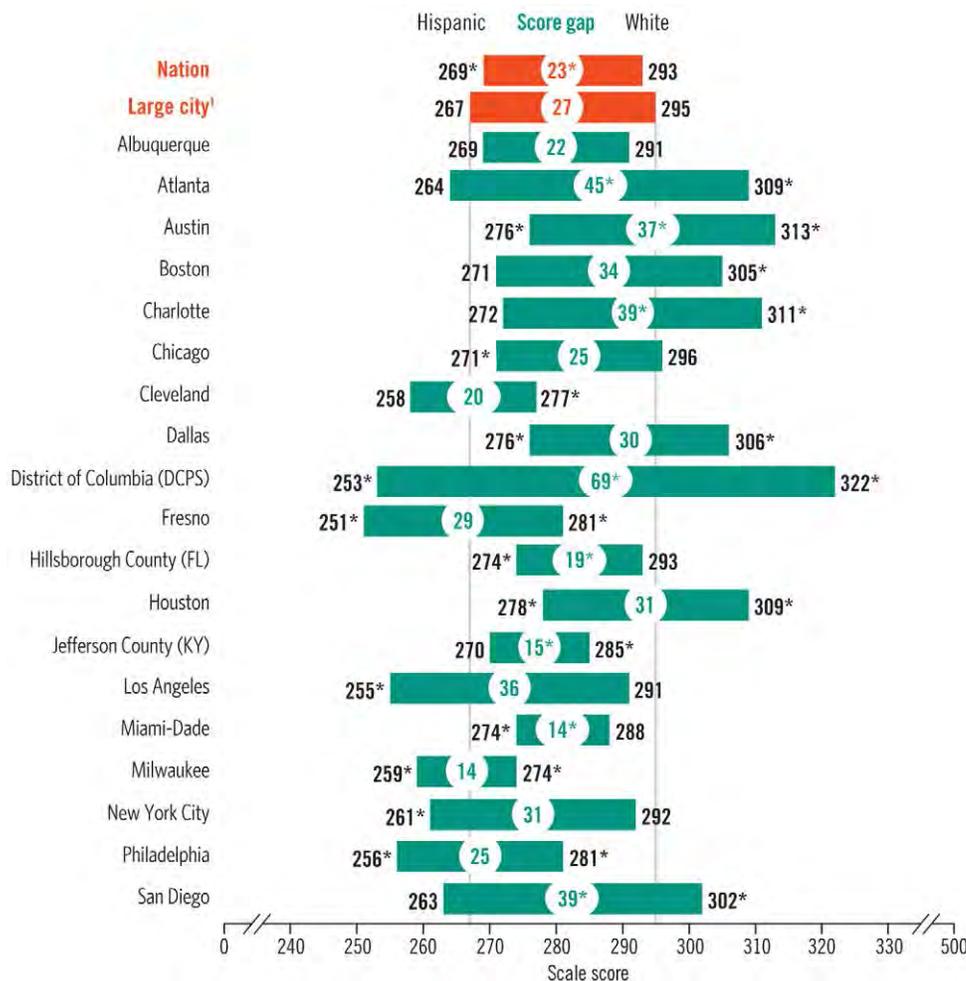

In comparison to large cities, White – Hispanic score gaps smaller in three districts and larger in five districts

In 2011, the 27-point score gap between White and Hispanic eighth-graders in large cities was larger than the 23-point White – Hispanic score gap for the nation (figure 15). The White – Hispanic score gaps in the districts ranged from 14 points in Miami-Dade and Milwaukee to 69 points in the District of Columbia. (Note that sample sizes were not large enough to report results for Hispanic students in Baltimore City or White students in Detroit.)

White – Hispanic score gaps in Hillsborough County, Jefferson County, and Miami-Dade were smaller than the score gap for large cities. In Hillsborough County and Miami-Dade, scores for Hispanic students were higher than the score for Hispanic students in large cities, and the scores for White students in the districts were not significantly different from the score for White students in large cities. In Jefferson County, the score for White students was lower than the score for White students in large cities, and the score for Hispanic students was not significantly different from the score for large cities.

White – Hispanic score gaps in Atlanta, Austin, Charlotte, the District of Columbia, and San Diego were larger than the score gap for large cities. In Atlanta, Charlotte, the District of Columbia, and San Diego, scores for White students were higher than the score for White students in large cities, and scores for Hispanic students were either lower than or not significantly different from the score for large cities. In Austin, scores for both White and Hispanic students were higher than the scores for their peers in large cities.

Figure 15. Average scores and score gaps in NAEP mathematics for White and Hispanic eighth-grade public school students, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.
¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
 NOTE: White excludes students of Hispanic origin. Hispanic includes Latino. Score gaps are calculated based on differences between unrounded average scores. Sample sizes were insufficient to permit reliable estimates for Hispanic students in Baltimore City and for White students in Detroit, so results are not shown for these two districts. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

White, Black, and Hispanic students in four districts score higher than in 2003

Scores for White, Black, and Hispanic eighth-graders in the nation were higher in 2011 than in 2003, and both the White – Black and White – Hispanic score gaps narrowed in comparison to 2003 (figure 16). Although scores for all three racial/ethnic groups in large cities were also higher in 2011 than in 2003, only the White – Black gap was smaller than in 2003.

Scores were higher in 2011 than in 2003 for White, Black, and Hispanic students in Boston, Chicago, Houston, and Los Angeles. Among the remaining districts that participated in both years, scores were higher in 2011 for two of the groups in Charlotte and San Diego, and one group in Atlanta, the District of Columbia, and New York City. Even with higher scores for some racial/ethnic groups, neither the White – Black nor White – Hispanic score gap narrowed in any of the districts. The White – Black score gap widened from 2003 to 2011 in San Diego, where the score for White students was higher than in 2003, but there was no significant change in the score for Black students.

Although not shown in the figure, there were some changes from 2009 to 2011 in the White – Black score gap for some districts. The White – Black score gap widened from 2009 to 2011 in Charlotte, where the score for White students was higher than in 2009, but the score for Black students did not change significantly. The White – Black score gap in Boston narrowed from 2009 to 2011 although the score for each group by itself did not change significantly. There were no significant changes in the White – Hispanic score gaps from 2009 to 2011 in any of the participating districts (see the district profiles presented later in this report).

Figure 16. Changes between 2003 and 2011 NAEP mathematics average scores and score gaps for eighth-grade public school students, by selected racial/ethnic groups and jurisdiction

Jurisdiction	All students	Race/ethnicity			Score gap

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Included in the overall results but not shown separately are students whose race/ethnicity was Asian/Pacific Islander, American Indian/Alaska Native, unclassified, or two or more races. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin. DCPS = District of Columbia Public Schools.

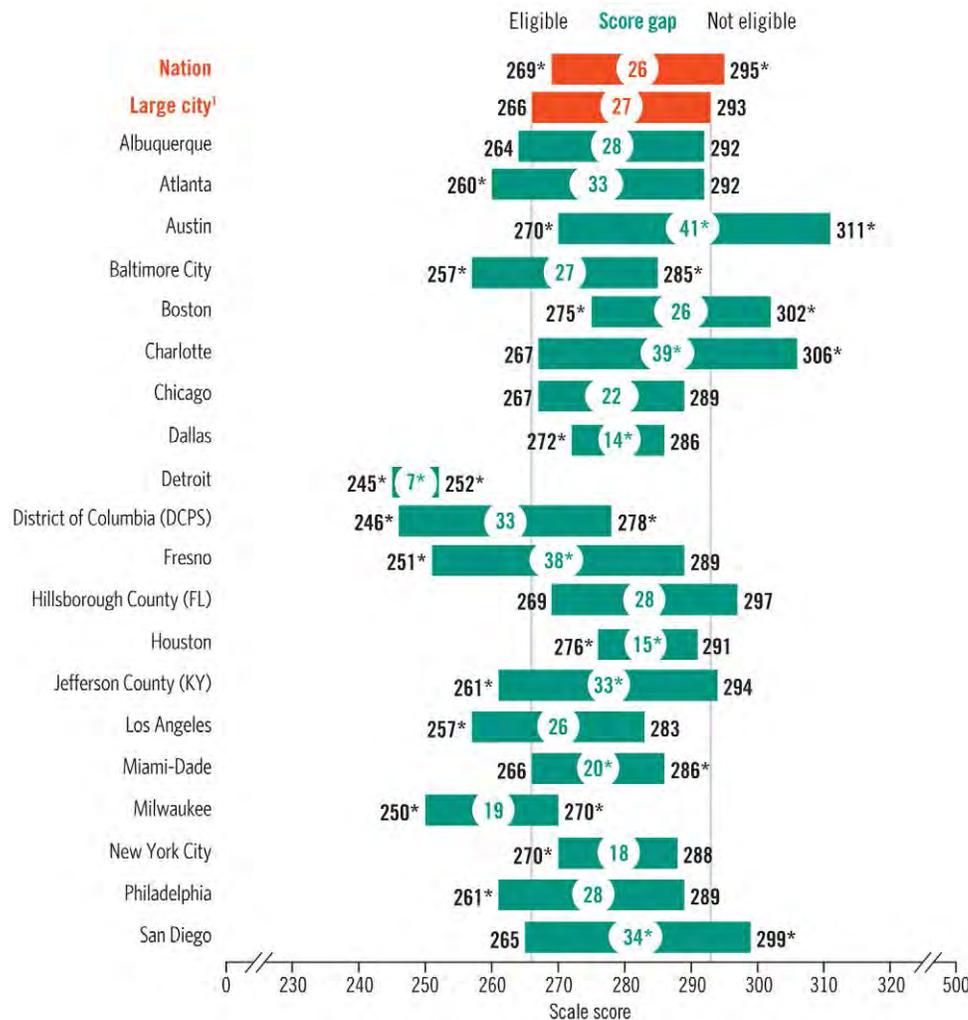

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 and 2011 Mathematics Assessments.

In comparison to large cities, score gaps between higher- and lower-income students are smaller in four districts and larger in five districts

In 2011, the 27-point score gap between eighth-graders in large cities who were not eligible for NSLP (higher-income students) and those who were eligible (lower-income students) was not significantly different from the 26-point score gap for students in the nation (figure 17). The score gaps between higher- and lower-income students in the districts ranged from 7 points in Detroit to 41 points in Austin.

The score gaps between higher- and lower-income students in four districts were smaller than the score gap for large cities overall. In Dallas and Houston, the scores for lower-income students were higher than the score for their peers in large cities, and the scores for higher-income students in those districts were not significantly different from large cities. However, not all of the districts with gaps smaller than the gap for large cities also had higher scores for lower-income students. In Miami-Dade, the score for lower-income students was not significantly different from the score for their peers in large cities, and the score for higher-income students was lower than the score for large cities. In Detroit, scores for both higher- and lower-income students were lower than the scores for large cities.

Figure 17. Average scores and score gaps in NAEP mathematics for eighth-grade public school students eligible and not eligible for free/reduced-price school lunch, by jurisdiction: 2011

* Significantly different ($p < .05$) from large city.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts. NOTE: Score gaps are calculated based on differences between unrounded average scores. In Cleveland, all students were categorized as eligible for the National School Lunch Program (NSLP). Therefore, a score gap comparison between students eligible and not eligible for NSLP could not be shown for this district. DCPS = District of Columbia Public Schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Score gaps between higher- and lower-income students in five districts were larger in comparison to the score gap in 2011 for large cities overall. In Fresno and Jefferson County, the scores for higher-income students were not significantly different from the score for large cities, and the scores for lower-income students were lower. However, not all of the districts with gaps larger than large cities also had lower scores for lower-income students. In Charlotte and San Diego, scores for higher-income students were higher than the score for higher-income students in large cities, and the scores for lower-income students were not significantly different from the score for large cities. In Austin, the scores for both higher- and lower-income students were higher in comparison to the scores for their peers in large cities.

Both higher- and lower-income students in seven districts score higher than in 2003

Scores for students who were not eligible for NSLP (higher-income students) and those who were eligible (lower-income students) were higher in 2011 than in 2003 in the nation and large cities (figure 18). However, of these two, only the score gap for the nation narrowed.

Scores were higher in 2011 than in 2003 for both higher-income and lower-income students in seven of the nine districts where results could be reported for both groups. Even with higher scores for lower-income students in most of the participating districts, only the score gap in New York City narrowed in comparison to 2003, and score gaps widened in the District of Columbia, Los Angeles, and San Diego.

Although not shown in the figure, there were changes from 2009 to 2011 in the score gap between higher- and lower-income students in some districts. The gap narrowed from 2009 to 2011 in Houston, where the score for lower-income students was higher than in 2009, but the score for higher-income students did not change significantly. Score gaps widened from 2009 to 2011 in Baltimore City and Charlotte, where scores for higher-income students were higher in 2011 than in 2009, but scores for lower-income students did not change significantly (see the district profiles presented later in this report).

Figure 18. Changes between 2003 and 2011 NAEP mathematics average scores and score gaps for eighth-grade public school students, by eligibility for free/reduced-price school lunch and jurisdiction

Jurisdiction	All students	Eligibility for free/ reduced-price school lunch		Score gap
		Not eligible	Eligible	Not eligible – Eligible
Nation	▲	▲	▲	Narrowed
Large city¹	▲	▲	▲	◆
Atlanta	▲	▲	▲	◆
Boston	▲	▲	▲	◆
Charlotte	▲	▲	▲	◆
Chicago	▲	◆	▲	◆
Cleveland	◆	‡	◆	‡
District of Columbia (DCPS)	▲	▲	▲	Widened
Houston	▲	▲	▲	◆
Los Angeles	▲	▲	▲	Widened
New York City	▲	◆	▲	Narrowed
San Diego	▲	▲	▲	Widened

▲ Higher in 2011.

◆ Not significantly different from 2011.

‡ Reporting standards not met. Sample size insufficient to permit a reliable estimate.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Included in the overall results but not shown separately are students whose eligibility status for the National School Lunch Program was not available. DCPS = District of Columbia Public Schools.

Explore Additional Results

Results for other background questions from the eighth-grade student, teacher, and school questionnaires are available in the NAEP Data Explorer at <http://nces.ed.gov/nationsreportcard/naepdata/>.

Coursetaking patterns vary across the 21 participating districts

Eighth-graders participating in the 2011 NAEP mathematics assessment were asked what math class they were taking that year. Students selected one course from the following list:

- Geometry
- Algebra II
- Algebra I (one-year course)
- First year of a two-year Algebra I course
- Second year of a two-year Algebra I course
- Introduction to algebra or pre-algebra
- Basic or general eighth-grade math
- Integrated or sequential math
- Other math class

In 2011, the majority of eighth-grade students in the nation reported taking one of three mathematics classes: 33 percent in algebra I, 22 percent in introduction to algebra or pre-algebra, and 26 percent in basic or general eighth-grade math (**table 5**). The percentages of eighth-graders in large cities who reported taking algebra I or basic math were not significantly different from the percentages of students in the nation. The percentage of students in large cities taking introduction to algebra or pre-algebra was smaller than the percentage for the nation.

The percentages of students taking each of the three classes varied across the districts. The percentages of students taking algebra I ranged from 11 percent in Atlanta to 77 percent in Hillsborough County. The percentages of students taking introduction to algebra I or pre-algebra ranged from 4 percent in Hillsborough County to 29 percent in Miami-Dade. The percentages of students taking basic math ranged from 3 percent in Hillsborough County and Los Angeles to 54 percent in Austin.

Table 5. Percentage of eighth-grade public school students assessed in NAEP mathematics, by the type of mathematics class taken during the school year and jurisdiction: 2011

Jurisdiction	Basic or general eighth-grade math	Introduction to algebra or pre-algebra	Algebra I (one-year course)
Nation	26	22	33
Large city¹	27	16	34
Albuquerque	35	16	30
Atlanta	50	10	11
Austin	54	9	21
Baltimore City	27	17	34
Boston	14	14	54
Charlotte	38	17	31
Chicago	41	14	24
Cleveland	46	10	20
Dallas	52	8	26
Detroit	45	14	12
District of Columbia (DCPS)	9	26	40
Fresno	14	15	44
Hillsborough County (FL)	3	4	77
Houston	46	15	24
Jefferson County (KY)	28	17	31
Los Angeles	3	19	55
Miami-Dade	22	29	30
Milwaukee	36	13	14
New York City	43	6	15
Philadelphia	34	17	20
San Diego	5	12	54

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Results are not shown for the other types of mathematics classes taken by students. DCPS = District of Columbia Public Schools.

Assessment Content at Grade 8

Additional insight into students' performance on the NAEP mathematics assessment can be obtained by examining what eighth-graders are expected to know and be able to do and how they performed on some of the assessment questions designed to measure their knowledge and skills.

Mathematics Achievement-Level Descriptions for Grade 8

NAEP mathematics achievement-level descriptions outline expectations of student performance at each grade. The specific descriptions of what eighth-graders should know and be able to do at the *Basic*, *Proficient*, and *Advanced* mathematics achievement levels are presented below. (Note that the shaded text is a short, general summary to describe performance at each achievement level.)

NAEP achievement levels are cumulative; therefore, students performing at the *Proficient* level also display the competencies associated with the *Basic* level, and students at the *Advanced* level also demonstrate the skills and knowledge associated with both the *Basic* and the *Proficient* levels. The cut score indicating the lower end of the score range for each level is noted in parentheses.

Basic (262)

Eighth-grade students performing at the *Basic* level should exhibit evidence of conceptual and procedural understanding in the five NAEP content areas. This level of performance signifies an understanding of arithmetic operations—including estimation—on whole numbers, decimals, fractions, and percents.

Eighth-graders performing at the *Basic* level should complete problems correctly with the help of structural prompts such as diagrams, charts, and graphs. They should be able to solve problems in all NAEP content areas through the appropriate selection and use of strategies and technological tools—including calculators, computers, and geometric shapes. Students at this level also should be able to use fundamental algebraic and informal geometric concepts in problem solving.

As they approach the *Proficient* level, students at the *Basic* level should be able to determine which of the available data are necessary and sufficient for correct solutions and use them in problem solving. However, these eighth-graders show limited skill in communicating mathematically.

Proficient (299)

Eighth-grade students performing at the *Proficient* level should apply mathematical concepts and procedures consistently to complex problems in the five NAEP content areas.

Eighth-graders performing at the *Proficient* level should be able to conjecture, defend their ideas, and give supporting examples. They should understand the connections among fractions, percents, decimals, and other mathematical topics such as algebra and functions. Students at this level are expected to have a thorough understanding of *Basic* level arithmetic operations—an understanding sufficient for problem solving in practical situations.

Quantity and spatial relationships in problem solving and reasoning should be familiar to them, and they should be able to convey underlying reasoning skills beyond the level of arithmetic. They should be able to compare and contrast mathematical ideas and generate their own examples. These students should make inferences from data and graphs; apply properties of informal geometry; and accurately use the tools of technology. Students at this level should understand the process of gathering and organizing data and be able to calculate, evaluate, and communicate results within the domain of statistics and probability.

Advanced (333)

Eighth-grade students performing at the *Advanced* level should be able to reach beyond the recognition, identification, and application of mathematical rules in order to generalize and synthesize concepts and principles in the five NAEP content areas.

Eighth-graders performing at the *Advanced* level should be able to probe examples and counterexamples in order to shape generalizations from which they can develop models. Eighth-graders performing at the *Advanced* level should use number sense and geometric awareness to consider the reasonableness of an answer. They are expected to use abstract thinking to create unique problem-solving techniques and explain the reasoning processes underlying their conclusions.

What Eighth-Graders Know and Can Do in Mathematics

The item map below is useful for understanding performance at different levels on the NAEP scale. The scale scores on the left represent the scores for students who were likely to get the items correct or complete. The cut score at the lower end of the range for each achievement level is boxed. The descriptions of selected assessment questions indicating what students need to do to answer the question correctly, along with the corresponding mathematics content areas, are listed on the right.

For example, the map on this page shows that eighth-graders performing at the *Basic* level with a score of 290 were likely to solve a story problem that involves computing with money. Students performing at the *Proficient* level with a score of 317 were likely to be able to use an algebraic model to estimate height. Students performing at the *Advanced* level with a score of 346 were likely to be able to use number properties to determine the parity of an unknown number.

GRADE 8 NAEP MATHEMATICS ITEM MAP

	Scale score	Content area	Question description
	500		
	//		
<i>Advanced</i>	394	Algebra	Solve problems based on a linear graph (calculator available)
	355	Data analysis, statistics, and probability	Make a prediction using a line of best fit
	346	Number properties and operations	Use number properties to determine the parity of an unknown number
	334	Algebra	<i>Determine equation of a line given a point and the slope (shown on page 46)</i>
	333	Measurement	<i>Recognize a unit of volume</i>
	333	Geometry	<i>Compare similar parallelograms (calculator available)</i>
	333		
<i>Proficient</i>	332	Algebra	Set up and solve an algebraic equation
	331	Algebra	Compute the slope and y-intercept given an equation of a line
	330	Number properties and operations	<i>Solve a story problem using ratios</i>
	325	Measurement	Solve a problem involving unit conversions (calculator available)
	317	Algebra	<i>Use an algebraic model to estimate height</i>
	315	Geometry	Draw lines of symmetry (calculator available)
	306	Geometry	<i>Determine radius of a circle inscribed in a square (calculator available)</i>
	302	Data analysis, statistics, and probability	Label a spinner for a given probability (calculator available) (shown on pages 44 and 45)
	299		
<i>Basic</i>	294	Algebra	<i>Choose an equation that describes the relationship in a table</i>
	294	Data analysis, statistics, and probability	<i>Use the average (mean) to solve a problem</i>
	290	Number properties and operations	Solve a story problem that involves computing with money (calculator available)
	285	Algebra	<i>Identify a graph that shows how speed changed (calculator available)</i>
	280	Geometry	<i>Identify congruent angles in a figure (shown on page 43)</i>
	272	Measurement	<i>Find the angle with a specified degree measure</i>
	265	Algebra	Read information from the graph of a function
	264	Number properties and operations	<i>Use measuring cups to describe a fraction (calculator available)</i>
	262		
	260	Data analysis, statistics, and probability	<i>Recognize misrepresented data</i>
	258	Measurement	<i>Solve a story problem involving rates (calculator available)</i>
	254	Geometry	<i>Identify a result of combining two shapes</i>
	250	Number properties and operations	<i>Use order of operations</i>

	0		

NOTE: Regular type denotes a constructed-response question. *Italic* type denotes a multiple-choice question. The position of a question on the scale represents the scale score attained by students who had a 65 percent probability of successfully answering a constructed-response question, or a 72 percent probability of correctly answering a five-option multiple-choice question. For constructed-response questions, the question description represents students' performance rated as completely correct. Scale score ranges for mathematics achievement levels are referenced on the map.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Mathematics Content Area: Geometry

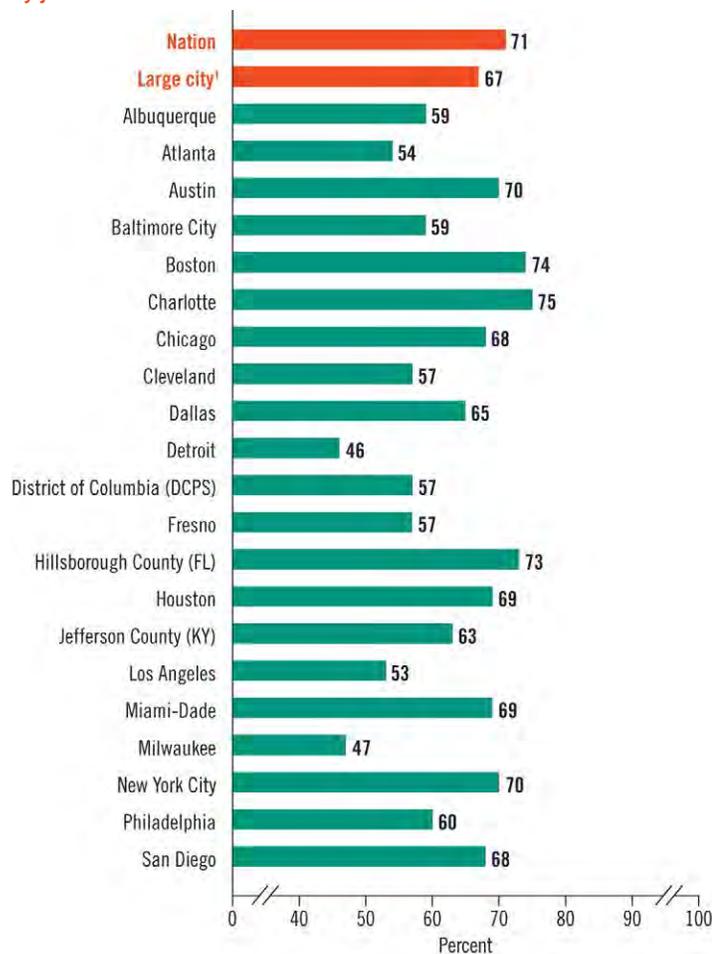

In this figure, line ℓ is parallel to line m . Which of the following pairs of angles must have the same measure?

- (A) Angles 1 and 2
- (B) Angles 1 and 5
- (C) Angles 2 and 3
- (D) Angles 4 and 5
- (E) Angles 4 and 8

In this multiple-choice question from the grade 8 mathematics assessment, students are presented with a set of parallel lines cut by a nonperpendicular transversal and are asked to identify a pair of angles that must have the same measure. This question requires students to use properties of parallel lines and transversals in order to recognize that angles 4 and 5 (Choice D) must have the same measure. The other answer choices represent different pairs of supplementary angles. Students were not permitted to use a calculator to answer this question.

Seventy-one percent of eighth-grade public school students in the nation selected the correct answer to this question. The percentage of correct responses in each of the TUDA districts ranged from 46 percent in Detroit to 75 percent in Charlotte.

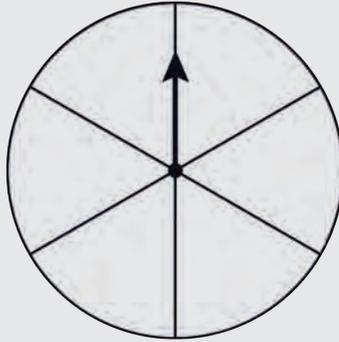

Percentage correct for eighth-grade public school students, by jurisdiction: 2011

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2011 Mathematics Assessment.

Mathematics Content Area: Data Analysis, Statistics, and Probability

The circular spinner shown below is divided into 6 congruent sectors. The sectors are yellow or blue.

Label each of the sectors either yellow (Y) or blue (B) so that the probability of spinning the arrow once and landing on yellow is $\frac{1}{3}$.

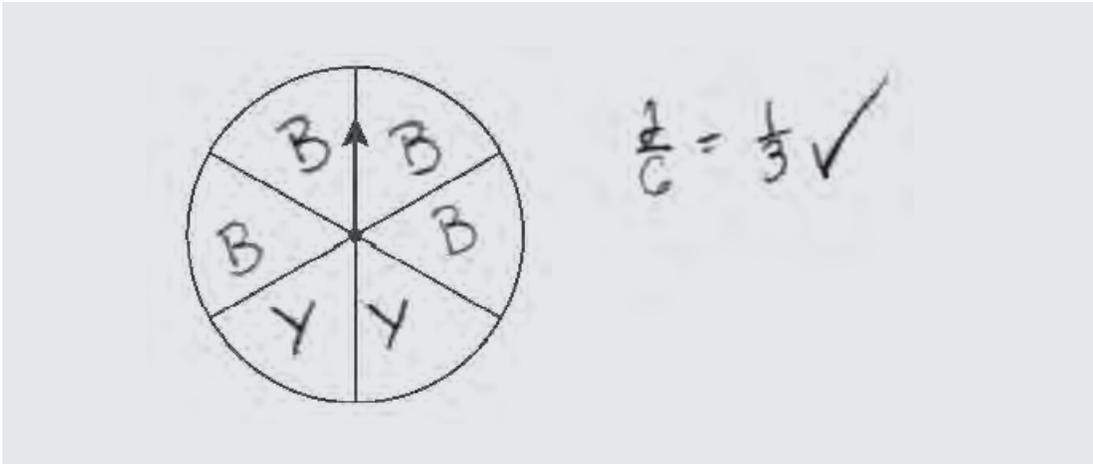

This short constructed-response question asks students to label (either yellow or blue) the sectors of a spinner that has been divided into 6 congruent sectors to match a given probability. To answer this question correctly, students must determine how many of the sectors need to be labeled yellow and how many sectors need to be labeled blue, so that the probability of spinning the arrow one time and landing on a sector labeled yellow is $\frac{1}{3}$. Students who correctly answered this question recognized that the given probability, $\frac{1}{3}$, needed to be converted to sixths to correspond to the 6 sectors on the spinner. Since $\frac{1}{3}$ is equivalent to $\frac{2}{6}$, a total of 2 sectors need to be labeled yellow, and the remaining 4 sectors need to be labeled blue. Students were permitted to use a calculator to solve this question.

Responses were rated using two scoring levels.

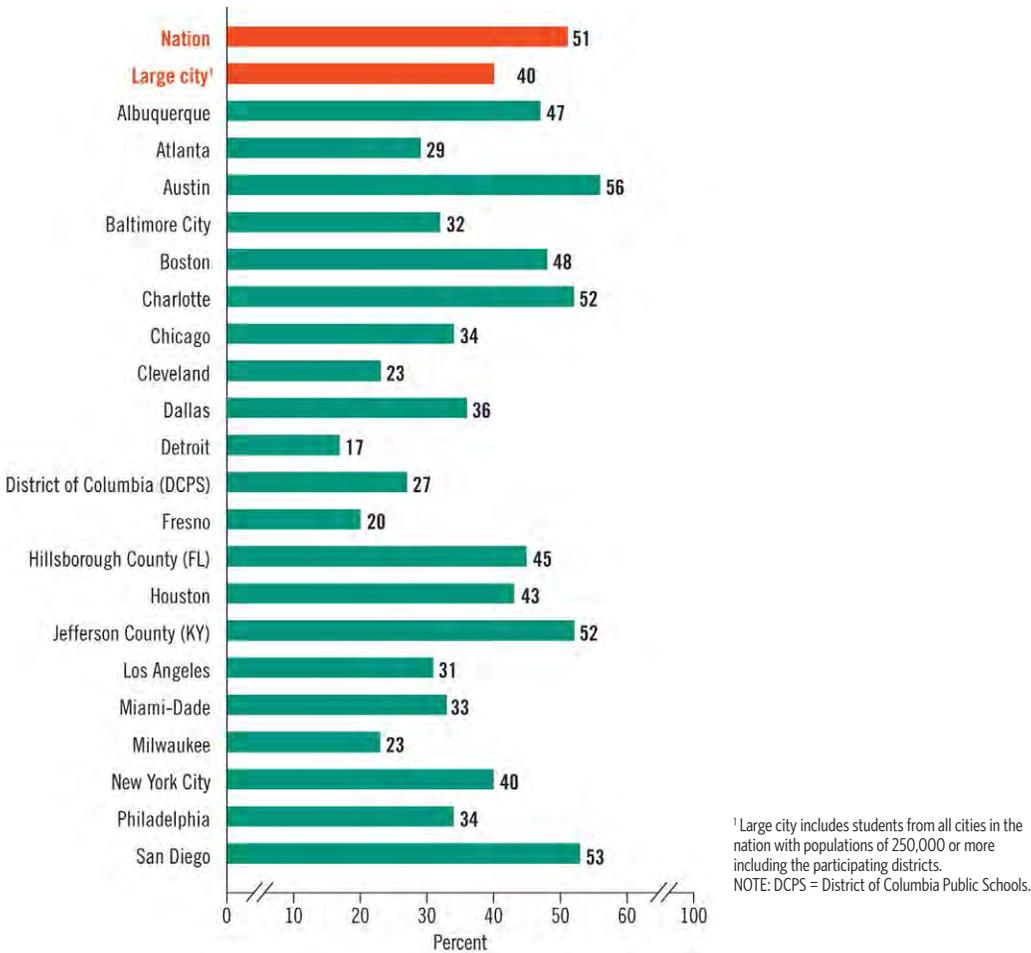

Correct responses labeled the spinner so that 2 sectors were labeled yellow and 4 sectors were labeled blue. (Part of the requirement for a rating of "Correct" was to label each sector of the spinner, including the correct number of blue sectors.)

Incorrect responses did not have the correct number of sectors labeled yellow or blue.

The student response shown below was rated as "Correct" because 2 sectors are labeled "Y" for yellow and 4 sectors are labeled "B" for blue. Fifty-one percent of eighth-grade public school students in the nation provided responses to this question that received a rating of "Correct." The percentage of correct responses in each TUDA district ranged from 17 percent in Detroit to 56 percent in Austin.

Percentage correct for eighth-grade public school students, by jurisdiction: 2011

See how well you perform on NAEP sample questions and how your answers relate to student performance in our Test Yourself tool at: http://nationsreportcard.gov/math_2011/sample_quest.asp.

Mathematics Content Area: Algebra

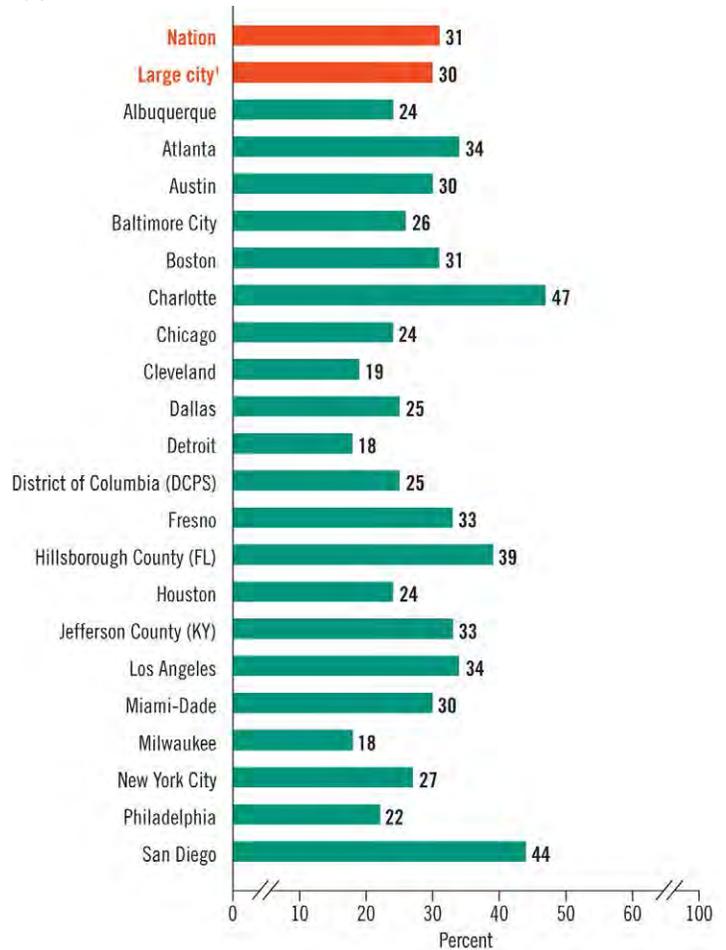

Which of the following is an equation of a line that passes through the point (0, 5) and has a negative slope?

- (A) $y = 5x$
- (B) $y = 5x - 5$
- (C) $y = 5x + 5$
- (D) $y = -5x - 5$
- (E) $y = -5x + 5$

This question asks students to identify an equation of a line that satisfies two conditions: the graph of the line passes through a given point, and it has a negative slope. The given point is the y-intercept of the graph of the line, and all answer choices were presented in slope-intercept form. Students were not permitted to use a calculator to answer this question.

The correct answer (Choice E) was selected by 31 percent of eighth-grade public school students in the nation. Students who correctly answered this question were able to recognize properties of a line written in slope-intercept form. The percentage of correct responses in each of the TUDA districts ranged from 18 percent in Detroit and Milwaukee to 47 percent in Charlotte.

Percentage correct for eighth-grade public school students by jurisdiction: 2011

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

District Profiles

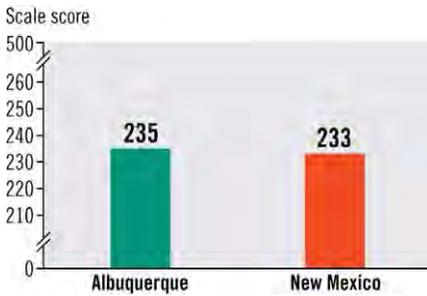

Individual district profiles provide a closer look at some key findings for the districts, including how districts' scores compare with scores in their home states, how the performance of higher- and lower-income students in the districts compares, how racial/ethnic groups within the districts compare, and how the performance of students has changed in those districts that participated in earlier assessment years. Web-generated profiles or “snapshots” of district results are available for each participating district at <http://nces.ed.gov/nationsreportcard/pubs/dst2011/2012453.asp>.

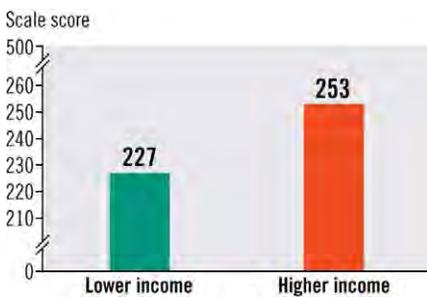

Albuquerque

Average scores in NAEP mathematics for fourth-graders in Albuquerque and New Mexico: 2011

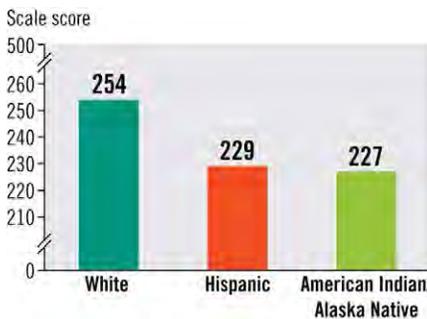

Average scores in NAEP mathematics for fourth-graders in Albuquerque, by family income: 2011

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP.

Average scores in NAEP mathematics for fourth-graders in Albuquerque, by race/ethnicity: 2011

NOTE: Results are not shown for all race/ethnicity categories because of insufficient sample sizes. Hispanic includes Latino. Race categories exclude Hispanic origin.

For Albuquerque fourth-graders in 2011,

- the overall average score was 235.
- the average score of 235 was at the 42nd percentile for the nation.

The district-to-state comparison showed

- a higher overall score than for New Mexico.

Results for higher- and lower-income students showed

- a 26-point score gap between higher- and lower-income students.

Results for racial/ethnic groups showed

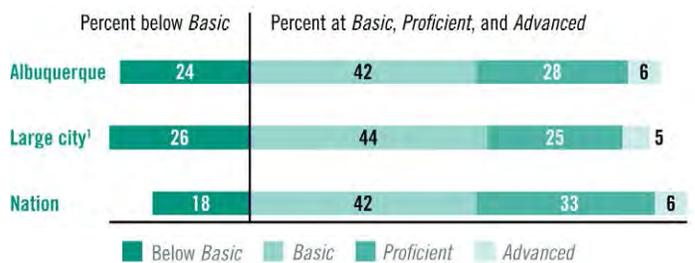

- a White – Hispanic score gap of 25 points.
- a White – American Indian/Alaska Native score gap of 26 points.¹

Achievement-level results showed

- no significant difference in the percentage at or above *Basic* compared to large cities.
- no significant difference in the percentage at or above *Proficient* compared to large cities.

¹ The score-point difference is based on the difference between the unrounded scores as opposed to the rounded scores shown in the figure.

Achievement-level results in NAEP mathematics for fourth-graders in Albuquerque: 2011

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding.

Albuquerque

For Albuquerque eighth-graders in 2011,

- the overall average score was 275.
- the average score of 275 was at the 40th percentile for the nation.

The district-to-state comparison showed

- no significant difference from the overall score for New Mexico.

Results for higher- and lower-income students showed

- a 28-point score gap between higher- and lower-income students.

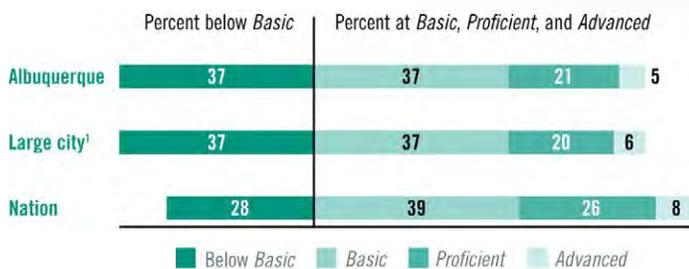

Results for racial/ethnic groups showed

- a White - Hispanic score gap of 22 points.

Achievement-level results showed

- no significant difference in the percentage at or above *Basic* compared to large cities.
- no significant difference in the percentage at or above *Proficient* compared to large cities.

Achievement-level results in NAEP mathematics for eighth-graders in Albuquerque: 2011

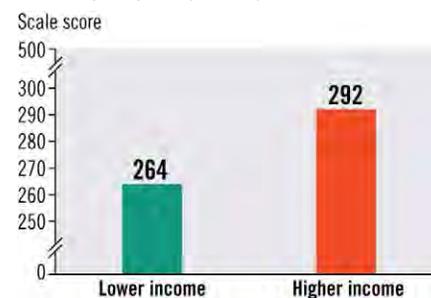

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding.

Average scores in NAEP mathematics for eighth-graders in Albuquerque and New Mexico: 2011

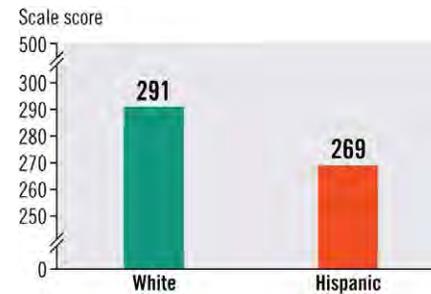

Average scores in NAEP mathematics for eighth-graders in Albuquerque, by family income: 2011

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP.

Average scores in NAEP mathematics for eighth-graders in Albuquerque, by race/ethnicity: 2011

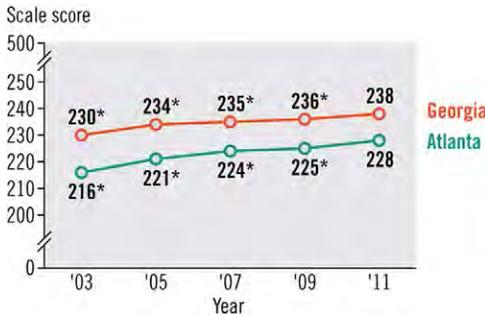

NOTE: Results are not shown for all race/ethnicity categories because of insufficient sample sizes. Hispanic includes Latino. White excludes students of Hispanic origin.

Atlanta

Trend in NAEP mathematics average scores for fourth-graders in Atlanta and Georgia

* Significantly different ($p < .05$) from 2011.

Trend in NAEP mathematics average scores for fourth-graders in Atlanta, by family income

* Significantly different ($p < .05$) from 2011.

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP.

Trend in NAEP mathematics average scores for fourth-graders in Atlanta, by race/ethnicity

* Significantly different ($p < .05$) from 2011.

¹ Sample sizes insufficient to permit reliable estimates for Hispanic students in 2003 and 2005.

NOTE: Results are not shown for all race/ethnicity categories because of insufficient sample sizes. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin.

For Atlanta fourth-graders in 2011,

- the overall score was higher than in 2003 and 2009.
- the average score of 228 was at the 32nd percentile for the nation.

The district-to-state comparison showed

- a lower overall score than for Georgia.
- a narrowing of the gap compared to 2003 but no significant change from 2009.

Results for higher- and lower-income students showed

- no significant change in the average score for higher-income students compared to 2003 but a higher average score compared to 2009.
- a higher average score for lower-income students compared to 2003 and 2009.

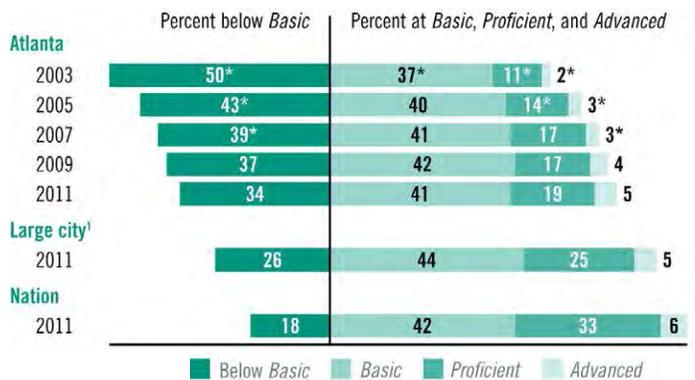

Results for racial/ethnic groups showed

- a higher average score for Black students compared to 2003 but no significant change from 2009.
- no significant change in the average score for White students compared to 2003 or 2009, or for Hispanic students compared to 2009.

Achievement-level results showed

- a higher percentage at or above *Basic* compared to 2003 but no significant change from 2009.
- a higher percentage at or above *Proficient* compared to 2003 and 2009.

Trend in NAEP mathematics achievement-level results for fourth-graders in Atlanta

* Significantly different ($p < .05$) from 2011.

Average scores in NAEP mathematics for eighth-graders in Miami-Dade, by family income: 2009 and 2011

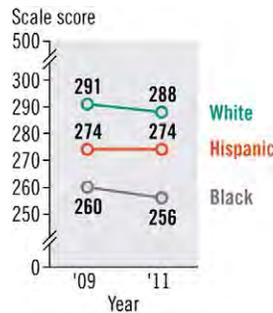

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP.

Achievement-level results in NAEP mathematics for eighth-graders in Miami-Dade: 2009 and 2011

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.
NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding.

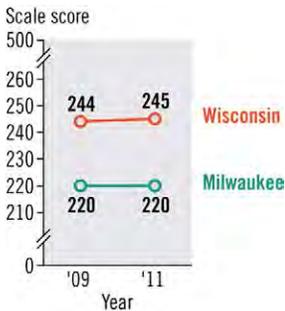

Average scores in NAEP mathematics for eighth-graders in Miami-Dade, by race/ethnicity: 2009 and 2011

NOTE: Results are not shown for all race/ethnicity categories because of insufficient sample sizes. Black includes African American, and Hispanic includes Latino. Race categories exclude Hispanic origin.

Milwaukee

Average scores in NAEP mathematics for fourth-graders in Milwaukee and Wisconsin: 2009 and 2011

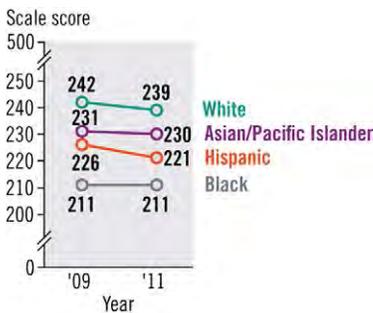

Average scores in NAEP mathematics for fourth-graders in Milwaukee, by family income: 2009 and 2011

NOTE: In NAEP, lower-income students are students identified as eligible for the National School Lunch Program (NSLP). Higher-income students are not eligible for NSLP.

Average scores in NAEP mathematics for fourth-graders in Milwaukee, by race/ethnicity: 2009 and 2011

NOTE: Results are not shown for all race/ethnicity categories because of insufficient sample sizes. Black includes African American, Hispanic includes Latino, and Pacific Islander includes Native Hawaiian. Race categories exclude Hispanic origin.

For Milwaukee fourth-graders in 2011,

- the overall score was not significantly different from 2009.
- the average score of 220 was at the 23rd percentile for the nation.

The district-to-state comparison showed

- a lower overall score than for Wisconsin.
- no significant change in the gap compared to 2009.

Results for higher- and lower-income students showed

- no significant change in average scores for higher- or lower-income students compared to 2009.

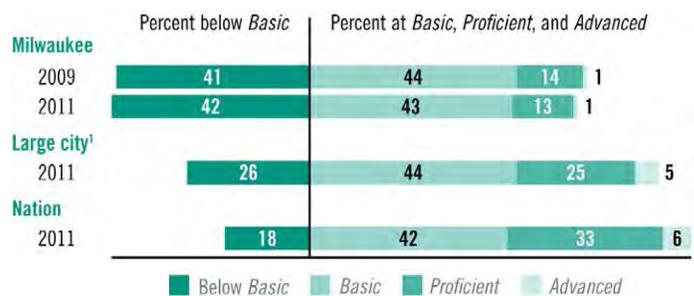

Results for racial/ethnic groups showed

- no significant change in average scores for White, Black, Hispanic, or Asian/Pacific Islander students compared to 2009.

Achievement-level results showed

- no significant change in the percentage at or above *Basic* compared to 2009.
- no significant change in the percentage at or above *Proficient* compared to 2009.

Achievement-level results in NAEP mathematics for fourth-graders in Milwaukee: 2009 and 2011

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: The shaded bars are graphed using unrounded numbers. Detail may not sum to totals because of rounding.

Milwaukee

For Milwaukee eighth-graders in 2011,

- the overall score was not significantly different from 2009.
- the average score of 254 was at the 21st percentile for the nation.

The district-to-state comparison showed

- a lower overall score than for Wisconsin.
- no significant change in the gap compared to 2009.

Results for higher- and lower-income students showed

- no significant change in average scores for higher- or lower-income students compared to 2009.

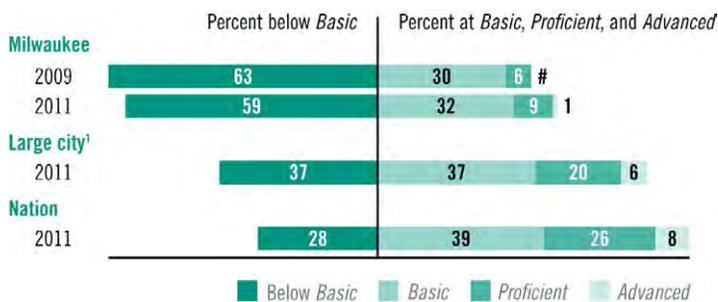

Results for racial/ethnic groups showed

- no significant change in average scores for White, Black, or Hispanic students compared to 2009.

Achievement-level results showed

- no significant change in the percentage at or above *Basic* compared to 2009.
- no significant change in the percentage at or above *Proficient* compared to 2009.

Achievement-level results in NAEP mathematics for eighth-graders in Milwaukee: 2009 and 2011

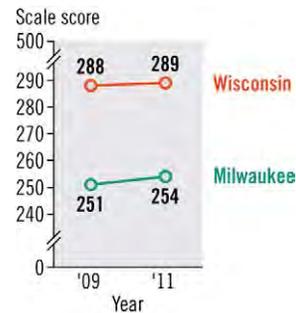

Rounds to zero.

NAEP Inclusion

It is important for NAEP to assess as many students selected to participate as possible. Assessing representative samples of students, including students with disabilities (SD) and English language learners (ELL), helps to ensure that NAEP results accurately reflect the educational performance of all students in the target population and can continue to serve as a meaningful measure of U.S. students' academic achievement over time.

The National Assessment Governing Board, which sets policy for NAEP, has been exploring ways to ensure that NAEP continues to appropriately include as many students as possible and to do so in a consistent manner for all jurisdictions assessed and reported. In March 2010, the Governing Board adopted a new policy, *NAEP Testing and Reporting on Students with Disabilities and English Language Learners*. This policy was the culmination of work with experts in testing and curriculum, and those who work with exceptional children and students learning to speak English. The policy aims to

- maximize participation of sampled students in NAEP,
- reduce variation in exclusion rates for SD and ELL students across states and districts,
- develop uniform national rules for including students in NAEP, and
- ensure that NAEP is fully representative of SD and ELL students.

The policy defines specific inclusion goals for NAEP samples. At the national, state, and district levels, the goal is to include 95 percent of all students selected for the NAEP samples, and 85 percent of those in the NAEP sample who are identified as SD or ELL.

Students are selected to participate in NAEP based on a sampling procedure designed to yield a sample of students that is representative of students in all schools nationwide and in public schools within each state and TUDA district. First, schools are selected, and then students are sampled from within those schools without regard to disability or English language proficiency. Once students are selected, those previously identified as SD or ELL may be offered accommodations or excluded.

Districts vary in their proportions of special-needs students and in their policies on inclusion and the use of accommodations. Among the TUDA districts participating in 2011, identification rates for SD and/or ELL students ranged from 11 percent in Atlanta to 56 percent in Dallas at grade 4, and from 12 percent in Atlanta to 36 percent in Boston at grade 8. Large cities overall had higher percentages of students identified as ELL in 2011 (22 and 12 percent at grades 4 and 8, respectively) than the nation (11 and 6 percent at grades 4 and 8, respectively), as did 13 of 21 participating districts at grade 4, and 17 districts at grade 8. Nonetheless, districts have worked to ensure that all students who can meaningfully participate in the NAEP assessments are included. Of the 18 districts that participated in both 2009 and 2011, inclusion rates remained steady or increased for 16 districts at both grades. The new NAEP inclusion policy is an effort to ensure that this trend continues.

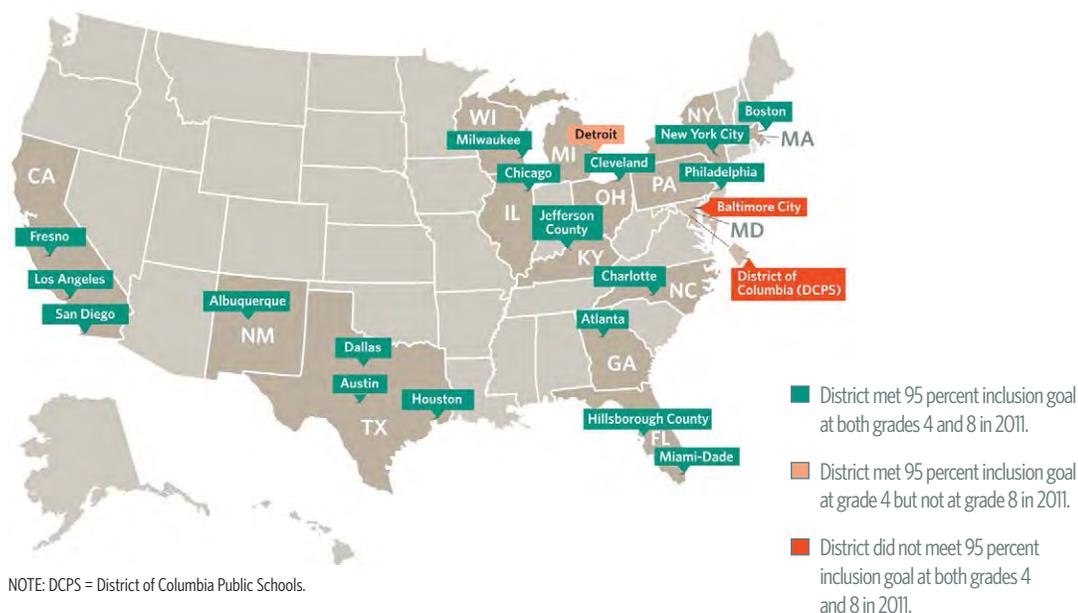

Determining whether each district has met the NAEP inclusion goals involves looking at three different inclusion rates—an overall inclusion rate, an inclusion rate for SD students, and an inclusion rate for ELL students. Each inclusion rate is calculated as the percentage of sampled students who were included in the assessment (i.e., were not excluded).

Inclusion rate percentages are estimates because they are based on representative samples of students rather than on the entire population of students. As such, the inclusion rates are associated with a margin of error. The margin of error for each district's inclusion rate was taken into

account when comparing it to the corresponding inclusion goal. For example, if the point estimate of a district's overall inclusion rate was 93 percent and had a margin of error of plus or minus 3 percentage points, the district was considered to have met the 95 percent inclusion goal because the 95 percent goal falls within the margin of error, which ranges from 90 percent to 96 percent. Refer to the Technical Notes for more details about how the margin of error was used in these calculations.

Most of the urban districts participating in the 2011 mathematics assessment met the 95 percent inclusion goal (figure 19). The goal was not met at grade 8 in Detroit, and at grades 4 and 8 in Baltimore City and the District of Columbia. See appendix table A-6 for the inclusion rates as a percentage of all students selected in each district, and table A-7 for the rates as a percentage of the SD or ELL students.

Figure 19. Districts meeting the 95 percent inclusion rate goal in NAEP mathematics at grades 4 and 8: 2011

Inclusion Policy

See the National Assessment Governing Board's policy on *NAEP Testing and Reporting on Students with Disabilities and English Language Learners* at http://www.nagb.org/policies/PoliciesPDFs/Reporting%20and%20Dissemination/naep_testandreport_studentswithdisabilities.pdf.

Technical Notes

Sampling and Weighting

The sample of students in the participating TUDA school districts is an extension of the sample of students who would usually be selected by NAEP as part of state and national samples. These extended samples allow reliable reporting of student groups within these districts. Results for students in the TUDA samples are also included in state and national samples with appropriate weighting.

In the same way that schools and students participating in NAEP assessments are chosen to be nationally representative, the schools and students participating in TUDA assessments are selected to be representative of their districts. The results from the assessed students are combined to provide accurate estimates of overall district performance. Results are weighted to take into account the fact that schools and students represent different proportions of the overall district population.

Results are reported for groups of students defined by shared characteristics such as race/ethnicity and eligibility for free/reduced-price school lunch only when sufficient numbers of students and adequate school representation are present. The minimum requirement is at least 62 students in a particular subgroup from at least five primary sampling units. However, the data for all students, regardless of whether their subgroup was reported separately, were included in computing overall results.

Charter Schools in District Samples

Some charter schools that operate within the geographic boundaries of a school district are independent of the district and are not included in the district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education under the Elementary and Secondary Education Act. Beginning in 2009, charter schools of this type were no longer included in the results for TUDA districts as they had been in past NAEP assessments.

School districts vary in whether the charter schools within their boundaries are independent of the districts. Prior to 2009, charter schools were included in the TUDA district results if they were listed as part of the district's Local Education Agency in the NCES Common Core of Data. Beginning in 2009, charter schools were included in TUDA district results if they contributed to the district's AYP results as part of the Elementary and Secondary Education Act.

School and Student Participation

District participation

To ensure that reported results are based on a sample that is representative of the target population, standards established by the National Assessment Governing Board require that school participation rates for the original district samples be at least 85 percent for results to be reported. In the 2011 mathematics assessment, all participating urban districts met participation rate standards at both grades 4 and 8 (see appendix [table A-1](#)).

Confidence intervals for district inclusion rates

NAEP endeavors to include as many sampled students as possible in the assessment, including students with disabilities (SD) and English language learners (ELL), and has established specific inclusion goals: 95 percent of all sampled students and 85 percent of sampled students identified as SD or ELL. Inclusion rates were computed for each district participating in the 2011 assessment and compared to NAEP inclusion goals. Specifically, Wilson confidence intervals were used in order to avoid having an upper bound greater than 1.

Three inclusion percentages were computed for each district. An overall inclusion percentage represents included students as a percentage of all students sampled within the district. In addition, separate percentages were computed to report included students as a percentage of the district sample that was identified as SD or ELL.

Inclusion percentages are estimates based on a sample, and each estimate has a measure of uncertainty or margin of error. Confidence intervals quantify this uncertainty due to sampling, resulting in interval estimates of the inclusion percentages. Therefore, confidence intervals for inclusion percentages were used to determine upper and lower confidence bounds around the inclusion point estimates.

When determining whether each district met the NAEP inclusion goals, the confidence intervals were used rather than just the point estimates. This means that if the inclusion goal of either 95 percent or 85 percent fell within the corresponding confidence interval, the district was considered as having met the goal. Districts for which the upper bound of the confidence interval was less than 95 percent (or 85 percent) did not meet the inclusion goal.

Interpreting Statistical Significance

Comparisons over time or between groups are based on statistical tests that consider both the size of the differences and the standard errors of the two statistics being compared. Standard errors are margins of error, and estimates based on smaller groups are likely to have larger margins of error. The size of the standard errors may also be influenced by other factors such as how representative the assessed students are of the entire population.

When an estimate has a large standard error, a numerical difference that seems large may not be statistically significant. Differences of the same magnitude may or may not be statistically significant depending upon the size of the standard errors of the estimates. For example, a 2-point change in the average score for large cities overall at grade 4 may be statistically significant, while a 2-point change in a district may not be. Similarly, seemingly large numerical differences or changes in score gaps may not be statistically significant when the gap has a large standard error. Standard errors of score gaps depend on the margins of error associated with both estimates being compared. Therefore, if one estimate is based on a smaller group (e.g., Hispanic students) and has a larger margin of error, the standard error of the gap will be correspondingly large. Standard errors for the estimates presented in this report are available at <http://nces.ed.gov/nationsreportcard/naepdata/>.

To ensure that significant differences in NAEP data reflect actual differences and not mere chance, error rates need to be controlled when making multiple simultaneous comparisons. The more comparisons that are made (e.g., comparing the performance of White, Black, Hispanic, and Asian/Pacific Islander students), the higher the probability of finding significant differences by chance. In NAEP, the Benjamini-Hochberg False Discovery Rate (FDR) procedure is used to control the expected proportion of falsely rejected hypotheses relative to the number of comparisons that are conducted. A detailed explanation of this procedure can be found at <http://nces.ed.gov/nationsreportcard/tdw/analysis/infer.asp>.

NAEP employs a number of rules to determine the number of comparisons conducted, which in most cases is simply the number of possible statistical tests. However, when comparing multiple years, the number of years do not count toward the number of comparisons.

A part-whole relationship exists between the district samples and large city overall, state, and national samples because each district is part of the large city sample and its home state sample, as well as the national public school sample. Therefore, when individual district results are compared to results for large city, a state, or the nation, the significance tests appropriately reflect this dependency.

When estimates of percentages are close to 0 or 100, reliable standard errors cannot be estimated. As a result, significance tests are not conducted when the comparison involves an extreme percentage. Refer to http://nces.ed.gov/nationsreportcard/tdw/analysis/infer_guidelines_extreme.asp for more information about how extreme percentages are defined in NAEP.

Race/Ethnicity

Prior to 2011, student race/ethnicity was obtained from school records and reported for the six mutually exclusive categories shown on the left side of the chart below. Students identified with more than one of the other five categories were classified as “other” and were included as part of the “unclassified” category, along with students who had a background other than the ones listed or whose race/ethnicity could not be determined.

Racial/ethnic categories	
Prior to 2011	In 2011
1. White	1. White
2. Black	2. Black
3. Hispanic	3. Hispanic
4. Asian/Pacific Islander	4. Asian
	5. Native Hawaiian/Other Pacific Islander
5. American Indian/Alaska Native	6. American Indian/Alaska Native
6. Other or unclassified	7. Two or more races

NOTE: Black includes African American, Hispanic includes Latino, and Pacific Islander includes Native Hawaiian. Race categories exclude Hispanic origin.

In compliance with new standards from the U.S. Office of Management and Budget for collecting and reporting data on race/ethnicity, additional information was collected in 2011 so that results could be reported separately for Asian students, Native Hawaiian/Other Pacific Islander students, and students identifying with two or more races. Beginning in 2011, all of the students participating in NAEP were identified as one of the seven racial/ethnic categories listed on the right side of the chart.

As in earlier years, students identified as Hispanic were classified as Hispanic in 2011 even if they were also identified with another racial/ethnic group. Students identified with two or more of the other racial/ethnic groups (e.g., White and Black) would have been classified as “other” and reported as part of the “unclassified” category prior to 2011, and were classified as “two or more races” in 2011.

When comparing the results for racial/ethnic groups from 2011 to earlier assessment years in this report, the 2011 data for Asian and Native Hawaiian/Other Pacific Islander students were combined into a single Asian/Pacific Islander category.

National School Lunch Program

NAEP collects data on student eligibility for the National School Lunch Program (NSLP) as an indicator of family income. Under the guidelines of NSLP, children from families with incomes below 130 percent of the poverty level are eligible for free meals. Those from families with incomes between 130 and 185 percent of the poverty level are eligible for reduced-price meals. (For the period July 1, 2010, through June 30, 2011, for a family of four, 130 percent of the poverty level was \$28,665, and 185 percent was \$40,793 in most states.)

Some schools provide free meals to all students irrespective of individual eligibility, using their own funds to cover the costs of non-eligible students. Under special provisions of the National School Lunch Act intended to reduce the administrative burden of determining student eligibility every year, schools can be reimbursed based on eligibility data for a single base year. Based on these provisions, participating schools with high percentages of eligible students can report all students as eligible for free lunch. This procedure was followed in Cleveland. For more information on NSLP, visit <http://www.fns.usda.gov/cnd/lunch/>.

Large City

Just as the national public sample is used as a benchmark for comparing results for states, results for urban districts are compared to results from large cities nationwide. Results for large cities are for public schools located in the urbanized areas of cities with populations of 250,000 or more. Large city is not synonymous with “inner city.” Schools in participating TUDA districts are also included in the results for large cities, even though some districts (Albuquerque, Atlanta, Austin, Charlotte, Cleveland, Dallas, Fresno, Hillsborough County, Houston, Jefferson County, Los Angeles, and Miami-Dade) include some schools not classified as large city schools.

Further comparisons of urban district data with large city data are available from the online Data Explorer on the NAEP website (<http://nces.ed.gov/nationsreportcard/naepdata/>). By selecting “Large city” as a jurisdiction in the NAEP Data Explorer, users will be able to replicate the results in this report and explore additional comparisons.

Appendix Tables

Table A-1. Public school and student participation rates for Trial Urban District Assessment in mathematics, by grade and district: 2011

Grade and district	School participation		Student participation	
	Student-weighted percent	Number of schools participating	Student-weighted percent	Number of students assessed
Grade 4

— Not available. District did not participate.

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Students identified as both SD and ELL were counted only once under the combined SD and/or ELL category, but were counted separately under the SD and ELL categories. SD includes students identified as having either an Individualized Education Program or protection under Section 504 of the Rehabilitation Act of 1973. Detail may not sum to totals because of rounding. DCPS = District of Columbia Public Schools.

— Not available. District did not participate.

Rounds to zero.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Students identified as both SD and ELL were counted only once under the combined SD and/or ELL category, but were counted separately under the SD and ELL categories. SD includes students identified as having either an Individualized Education Program or protection under Section 504 of the Rehabilitation Act of 1973. Detail may not sum to totals because of rounding. DCPS = District of Columbia Public Schools.

— Not available. District did not participate.

Rounds to zero.

* Significantly different ($p < .05$) from 2011.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

² In Cleveland, all students were categorized as eligible for the National School Lunch Program.

NOTE: Beginning in 2009, results for charter schools are excluded from the TUDA results if they are not included in the school district's Adequate Yearly Progress (AYP) report to the U.S. Department of Education. Black includes African American. Hispanic includes Latino, and Pacific Islander includes Native Hawaiian. Race categories exclude Hispanic origin. Results are not shown for students whose race/ethnicity was unclassified or two or more races, and for students whose eligibility status for free/reduced-price school lunch was not available. DCPS = District of Columbia Public Schools.

Rounds to zero.

‡ Reporting standards not met. Sample size insufficient to permit a reliable estimate.

* Significantly different ($p < .05$) from large city.

** Significantly different ($p < .05$) from the nation.

¹ Large city includes students from all cities in the nation with populations of 250,000 or more including the participating districts.

NOTE: SD includes students identified as having either an Individualized Education Program or protection under Section 504 of the Rehabilitation Act of 1973. The results for students with disabilities are based on students who were assessed and cannot be generalized to the total population of such students. DCPS = District of Columbia Public Schools.

U.S. Department of Education

The National Assessment of Educational Progress (NAEP) is a congressionally authorized project sponsored by the U.S. Department of Education. The National Center for Education Statistics, within the Institute of Education Sciences, administers NAEP. The Commissioner of Education Statistics is responsible by law for carrying out the NAEP project.

Arne Duncan
Secretary
U.S. Department
of Education

John Q. Easton
Director
Institute of
Education Sciences

Jack Buckley
Commissioner
National Center for
Education Statistics

Peggy G. Carr
Associate Commissioner
for Assessment
National Center for
Education Statistics

The National Assessment Governing Board

In 1988, Congress created the National Assessment Governing Board to set policy for the National Assessment of Educational Progress, commonly known as The Nation's Report Card™. The Governing Board is an independent, bipartisan group whose members include governors, state legislators, local and state school officials, educators, business representatives, and members of the general public.

Honorable David P. Driscoll, Chair
Former Commissioner of Education
Melrose, Massachusetts

Mary Frances Taymans,
Vice Chair
Sisters of Notre Dame
National Education Office
Bethesda, Maryland

Andrés Alonso
Chief Executive Officer
Baltimore City Public Schools
Baltimore, Maryland

David J. Alukonis
Former Chairman
Hudson School Board
Hudson, New Hampshire

Louis M. Fabrizio
Data, Research and Federal Policy Director
North Carolina Department of Public
Instruction
Raleigh, North Carolina

Honorable Anitere Flores
Senator
Florida State Senate
Miami, Florida

Alan J. Friedman
Consultant
Museum Development and Science
Communication
New York, New York

Shannon Garrison
Fourth-Grade Teacher
Solano Avenue Elementary School
Los Angeles, California

Doris R. Hicks
Principal and Chief Executive Officer
Dr. Martin Luther King, Jr. Charter School
for Science and Technology
New Orleans, Louisiana

Honorable Terry Holliday
Commissioner of Education
Kentucky Department of Education
Lexington, Kentucky

Richard Brent Houston
Principal
Shawnee Middle School
Shawnee, Oklahoma

Hector Ibarra
Middle School Science Teacher
Belin-Blank International Center
and Talent Development
Iowa City, Iowa

Honorable Tom Luna
Idaho Superintendent of Public
Instruction
Boise, Idaho

Honorable Jack Markell
Governor of Delaware
Wilmington, Delaware

Tonya Miles
General Public Representative
Mitchellville, Maryland

Dale Nowlin
Twelfth-Grade Teacher
Columbus North High School
Columbus, Indiana

Honorable Sonny Perdue
Former Governor of Georgia
Atlanta, Georgia

Susan Pimentel
Educational Consultant
Hanover, New Hampshire

W. James Popham
Professor Emeritus
Graduate School of Education and
Information Studies
University of California, Los Angeles
Wilsonville, Oregon

Andrew C. Porter
Dean
Graduate School of Education
University of Pennsylvania
Philadelphia, Pennsylvania

B. Fielding Rolston
Chairman
Tennessee State Board of Education
Kingsport, Tennessee

Cary Sneider
Associate Research Professor
